# 45 Gbps, XOR / XNOR w/ PROGRAMMABLE OUTPUT VOLTAGE

### Typical Applications

The HMC844LC4B is ideal for:

- RF ATE Applications
- Broadband Test & Measurement
- Serial Data Transmission up to 45 Gbps
- Digital Logic Systems up to 25 GHz

#### Functional Diagram

#### Supports High Data Rates: up to 45 Gbps Differential & Singe-Ended Operation Fast Rise and Fall Times: 11 / 10 ps Low Power Consumption: 510 mW Programmable Differential Output Voltage Swing: 200 - 850 mVp-p Single Supply: -3.3V

24 Lead 4x4 mm SMT Package: 16 mm<sup>2</sup>

#### **General Description**

Features

The HMC844LC4B is an XOR/XNOR function designed to support data transmission rates of up to 45 Gbps, and clock frequencies as high as 25 GHz. The HMC844LC4B may be easily configured to provide either XOR or XNOR logic functions. The HMC844LC4B also features an output level control pin, VAC, which allows for loss compensation or for signal level optimization.

All input signals to the HMC844LC4B are terminated with 50 Ohms-to-ground on-chip, and may be either AC or DC coupled. The differential outputs of the HMC844LC4B may be either AC or DC coupled. Outputs can be connected directly to a 50 Ohms-to-ground terminated system, while DC blocking capacitors should be used if the terminating system is 50 Ohms to a non-ground DC voltage. The HMC844LC4B operates from a single -3.3V DC supply, and is available in a ceramic RoHS compliant 4x4 mm SMT package.

## Electrical Specifications, $T_A = +25^{\circ}C$ , Vee = -3.3V

| Parameter                                 | Conditions                              | Min.  | Тур. | Мах   | Units |
|---|---|-------|------|-------|-------|
| Power Supply Voltage                      | ±5 % Tolerance                          | -3.47 | -3.3 | -3.13 | V     |
| Power Supply Current                      | VAC = -0.3V                             | 140   | 155  | 170   | mA    |

Reference this number when ordering complete evaluation PCB
 Circuit Board Material: Arlon 25FR or Rogers 4350

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads should be connected directly to the ground plane similar to that shown. The exposed metal package base must be connected to Vee. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
