
SLUS581 − FEBRUARY 2004

POWER MONITORING AND SWITCHING CONTROLLER FOR 3.3-V SRAM

FEATURES

- **Power Monitoring and Switching for Non-Volatile Control of SRAMs**
- **Input Decoder Allows Control of 1 or 2 Banks of SRAM**
- **Write-Protect Control**
- **3-V Primary Cell Input**
- **3.3-V Operation**
- **Reset Output for System Power-On Reset**
- **Less than 20-ns Chip Enable Propagation Delay**
- **Small 16-Lead TSSOP Package**

APPLICATIONS

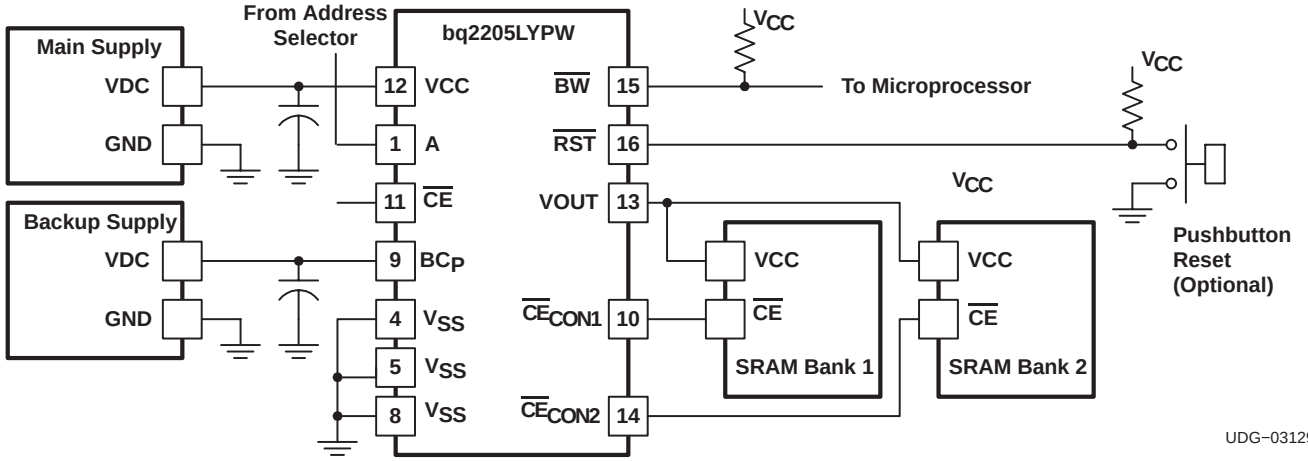
- **NVSRAM Modules**
- **Point-of-Sale Systems**
- **Facsimile, Printers and Photocopiers**
- **Internet Appliances**
- **Servers**
- **Medical Instrumentation and Industrial Products**

DESCRIPTION

The CMOS bq2205 SRAM non-volatile controller with reset provides all the necessary functions for converting one or two banks of standard CMOS SRAM into non-volatile read/write memory.

A precision comparator monitors the 3.3-V VCC input for an out-of-tolerance condition. When out-of-tolerance is detected, the two conditioned chip-enable outputs are forced inactive to write-protect both banks of SRAM.

Power for the external SRAMs, VOUT, is switched from the VCC supply to the battery-backup supply as VCC decays. On a subsequent power-up, the VOUT supply is automatically switched from the backup supply to the VCC supply. The external SRAMs are write-protected until a power-valid condition exists. The reset output provides power-fail and power-on resets for the system. During power-valid operation, the input decoder, A, selects one of two banks of SRAM.



Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

T_A	OPERATION	PART NUMBER(1)	SYMBOL
−20°C to 70°C	3.3 V	bq2205LYPW	bq2205LY

(1) The PW package is available taped and reeled. Add an R suffix to the device type (i.e. bq2205LYPWR) to order quantities of 2,000 devices per reel.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted(2)

		bq2205LY	UNIT
Input voltage range	V_{CC}, (wrt V_{SS})	−0.3 to 6.0	V
	BC_P, (wrt V_{SS})	−0.3 to 4.5	
	all other pins, (wrt V_{SS})	−0.3 to VCC + 0.3	
Operating temperature range, T_A		−20 to 70	°C
Storage temperature, T_{stg}		−55 to 125	
Temperature under bias, T_{Jbias}		−40 to 85	
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds		300	

(2) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

	MIN	MAX	UNIT
Supply voltage, V_{CC}	3.0	3.6	V
Supply voltage from backup cell, V_{BC}	2.0	4.0	
Low-level input voltage, V_{IL}	−0.3	0.8	
High-level input voltage, V_{IH}	2.2	V_{CC} + 0.3	
$\overline{RST}$ low-level input voltage, V_{IL}	−0.3	0.4	
$\overline{RST}$ high-level input voltage, V_{IH}	2.2	V_{CC} + 0.3	
Operating temperature range, T_A	−20	70	°C

ELECTRICAL CHARACTERISTICS

(T_A = 25°C, $V_{CC(min)} \le V_{CC} \le V_{CC(max)}$ unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT

FUNCTIONAL DESCRIPTION

Two banks of CMOS static RAM can be battery-backed using the VOUT and conditioned chip-enable output pins from the bq2205. As the voltage input VCC slews down during a power failure, the two-conditioned chip enable outputs, $\overline{CE}_{CON1}$ and $\overline{CE}_{CON2}$, are forced inactive independent of the chip enable input, $\overline{CE}$. This activity unconditionally write-protects the external SRAM as VCC falls to an out-of-tolerance threshold V_{PFD}. As the supply continues to fall past V_{PFD}, an internal switching device forces VOUT to the backup energy source. $\overline{CE}_{CON1}$ and $\overline{CE}_{CON2}$ are held high by the VOUT energy source.

During power-up, VOUT is switched back to the 3.3-V supply as VCC rises above the backup cell input voltage sourcing VOUT. Outputs $\overline{CE}_{CON1}$ and $\overline{CE}_{CON2}$ are held inactive for time t_{CER} after the power supply has reached V_{PFD}, independent of the $\overline{CE}$ input, to allow for processor stabilization.

During power-valid operation, the $\overline{CE}$ input is passed through to one of the two $\overline{CE}_{CONx}$ outputs with a propagation delay of less than t_{CED}. The $\overline{CE}$ input is output on one of the two $\overline{CE}_{CONx}$ output pins; depending on the level of bank select input A. See truth table below.

Table 1. Truth Table

INPUT		OUTPUT	
$\overline{CE}$	A	$\overline{CE}_{CON1}$	$\overline{CE}_{CON2}$
H	x	H	H
L	L	L	H
L	H	H	L

Bank select input A is usually tied to a high-order address pin so that a large nonvolatile memory can be designed using lower-density memory devices. Non-volatility and decoding are achieved by hardware hookup as shown in the application diagram.

The $\overline{RST}$ output can be used as the power-on reset for a microprocessor. Access to the external RAM may begin when $\overline{RST}$ returns inactive.

BATTERY BACKUP INPUT

Backup energy source, BC_P, input is provided on the bq2205 for use with an external primary cell. The primary cell input is designed to accept any 3-V primary battery (non-rechargeable), typically some type of lithium chemistry.

Power-Down and Power-Up Cycle

The bq2205 continuously monitors VCC for out-of-tolerance. During a power failure, when VCC falls below V_{PFD}, the bq2205 write-protects the external SRAM. The power source is switched to BC_P when V_{CC} is less than V_{PFD} and BC_P is greater than V_{PFD}, or when V_{CC} is less than BC_P and BC_P is less than V_{PFD}. When VCC is above V_{PFD}, the power source is V_{CC}. Write-protection continues for t_{CER} time after VCC rises above V_{PFD}.

An external CMOS static RAM is battery-backed using the VOUT and chip enable output pins from the bq2205. As the voltage input V_{CC} slews down during a power failure, the chip enable output, $\overline{CE}_{CONx}$, is forced inactive independent of the chip enable input $\overline{CE}$.

As the supply continues to fall past V_{PFD}, an internal switching device forces VOUT to the external backup energy source. $\overline{CE}_{CONx}$ is held high by the VOUT energy source.

FUNCTIONAL DESCRIPTION

During power up, VOUT is switched back to the main supply as VCC rises above the backup cell input voltage sourcing VOUT. If $V_{PFD} < BC_P$ on the bq2205 the switch to the main supply occurs at V_{PFD}. $\overline{CE}_{CONx}$ is held inactive for time t_{CER} after the power supply has reached V_{PFD}, independent of the $\overline{CE}$ input, to allow for processor stabilization.

Power-On Reset

The bq2205 provides a power-on reset, which pulls the $\overline{RST}$ pin low on power down and remains low on power up for t_{RST} after V_{CC} passes V_{PFD}. With valid battery voltage on BC_P, $\overline{RST}$ remains valid for $V_{CC} = V_{SS}$. The pull-up resistor on this pin should not exceed 10 kΩ if a push button reset is used.

Battery Low Warning

The bq2205 checks the battery voltage on power-up. The threshold for the battery warning comparator is V_{BW}, and a low level is sensed after power valid on each power up and latched after t_{CER} time. The latched value is presented at $\overline{BW}$ pin where a low indicates a low battery.

APPLICATION INFORMATION

PCB LAYOUT INFORMATION

It is important to pay special attention to the PCB layout. The following provides some guidelines:

- To obtain optimal performance, the decoupling capacitor from input terminals to V_{SS} should be placed as close as possible to the bq2205, with short trace runs to both signal and V_{SS} pins.
- All low-current V_{SS} connections should be kept separate from the high-current paths from the inputs supplies. Use a single-point ground technique incorporating both the small signal ground path and the power ground path.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
