

## TPS6105x High-Power White LED Driver 2-mHz Synchronous Boost Converter With Standard Logic Interface

### 1 Features

- Four Operational Modes
  - Torch and Flash up to  $I_{LED} = 700\text{ mA}$
  - Voltage-Regulated Boost Converter: 5.0 V
  - Shutdown: 0.3  $\mu\text{A}$  (Typical)
- Total Solution Circuit Area < 25 mm<sup>2</sup>
- Up to 96% Efficiency
- Integrated LED Turnon Safety Timer
- Zero Latency TX-Masking Input
- Integrated Low Light Dimming Mode
- LED Disconnect During Shutdown
- Open/Shorted LED Protection
- Over-Temperature Protection
- Available in a 12-Pin NanoFree™ (CSP) and 10-Pin VSON Packaging

### 2 Applications

- Camera White LED Torch or Flash for Cell Phones, Smartphones and PDAs
- General Lighting Applications
- Audio Amplifier Power Supply

### 3 Description

The TPS6105x device uses a high-frequency synchronous-boost topology with constant current sink to drive single white LEDs. The device uses an inductive fixed-frequency PWM control scheme using small external components, minimizing input ripple current.

The 2-MHz switching frequency allows the use of small and low-profile 2.2- $\mu\text{H}$  inductors. To optimize overall efficiency, the device operates with only a 250-mV LED feedback voltage.

The TPS6105x device not only operates as a regulated current source, but also as a standard voltage-boost regulator. This additional operating mode can be useful to supply other high-power devices in the system, such as a hands-free audio power amplifier, or any other component requiring a supply voltage higher than the battery voltage.

The LED current or the desired output voltage can be programmed through two logic signals (MODE0/1). To simplify flash synchronization with the camera module, the device offers a trigger pin (FLASH\_SYNC) for fast LED turnon time.

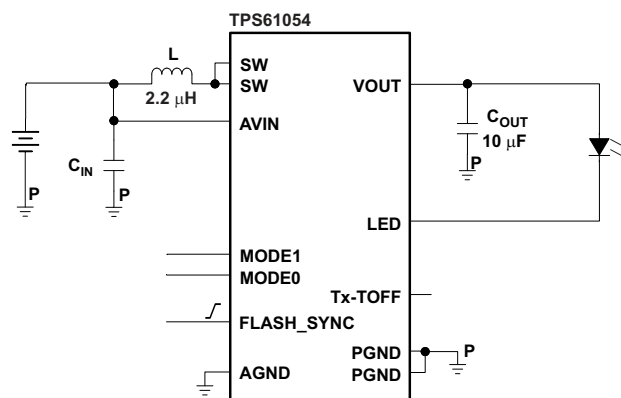

When the TPS6105x is not in use, it can be put into shutdown mode, reducing the input current to 0.3  $\mu\text{A}$  (typical). During shutdown, the LED pin is high impedance to avoid leakage current through the LED.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS61054, TPS61055	VSON (10)	3.00 mm × 3.00 mm
	DSBGA (12)	1.96 mm × 1.46 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

### Pin Functions

NAME	PIN		I/O	DESCRIPTION
	VSON	DSBGA		
AVIN	5	D3	I	This is the input voltage pin of the device. Connect directly to the input bypass capacitor.
VOUT	9	A2	O	Boost converter output.
LED	6	D2	I	LED return input. This feedback pin regulates the LED current through the internal sense resistor by regulating the voltage across it. The regulation operates with typically 250-mV dropout voltage. Connect to the cathode of the LED.
FLASH_SYNC	10	A1	I	Flash strobe pulse synchronization input.
				FLASH_SYNC = LOW (GND): The device is operating and regulating the LED current to the torch current level (TC).
				FLASH_SYNC = HIGH (VIN): The device is operating and regulating the LED current to the flash current level (FC).
MODE0	2	B3	I	Mode selection inputs. These pins must not be left floating and must be terminated.
MODE1	1	A3		MODE0 = 0, MODE1 = 0: Device in shutdown mode
				MODE0 = 1, MODE1 = 0: Device in torch only mode
				MODE0 = 0, MODE1 = 1: Device in torch and flash mode
				MODE0 = 1, MODE1 = 1: Device in constant voltage regulation mode
Tx-TOFF	3	C3	I	RF PA synchronization input.
				Tx-TOFF = LOW : The device is operating normally.
				Tx-TOFF = HIGH : The device is forced into torch mode.
SW	8	B1, B2	I/O	Inductor connection. Drain of the internal power MOSFET. Connect to the switched side of the inductor. SW is high impedance during shutdown.
PGND	7	C1, C2	—	Power ground. Connect to AGND underneath IC.
AGND	4	D1	—	Analog ground.
Thermal Pad	—	N/A	—	Internally connected to PGND.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
	Voltage on AVIN, VOUT, SW, LED <sup>(2)</sup>	-0.3	7	V
	Voltage on MODE0, MODE1, FLASH_SYNC, Tx-TOFF <sup>(2)</sup>	-0.3	7	V
T <sub>A</sub>	Operating ambient temperature <sup>(3)</sup>	-40	85	°C
T <sub>J (MAX)</sub>	Maximum operating junction temperature		150	°C
T <sub>stg</sub>	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.
- (3) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T<sub>A(max)</sub>) is dependent on the maximum operating junction temperature (T<sub>J(max)</sub>), the maximum power dissipation of the device in the application (P<sub>D(max)</sub>), and the junction-to-ambient thermal resistance of the part/package in the application (R<sub>θJA</sub>), as given by the following equation: T<sub>A(max)</sub> = T<sub>J(max)</sub> – (R<sub>θJA</sub> X P<sub>D(max)</sub>).

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)(2)</sup>	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(3)</sup>	±1000
		Machine Model	±200

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) The human body model is a 100-pF capacitor discharged through a 1.5-kΩ resistor into each pin. The machine model is a 200-pF capacitor discharged directly into each pin.
- (3) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>	Input voltage range	2.5	3.6	6	V
V <sub>OUT</sub>	Output voltage range in current regulator mode	V <sub>IN</sub>		5.5	V
	Output voltage range in voltage regulator mode	4.5	5	5.25	V
L	Inductance effective value range	1.3	2.2	2.9	μH
C <sub>IN</sub>	Input capacitance range		10		μF
C <sub>OUT</sub>	Input capacitance effective value range	3	10	50	μF
T <sub>J</sub>	Operating junction temperature	-40		125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	TPS61054, TPS61055		UNIT	
	DRC (VSON)	YZG (DSBGA)		
	10 PINS	12 PINS		
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	48.5	82.0	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	67.4	0.6	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	23.0	35.0	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	1.8	2.6	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	23.1	19.1	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	5.3	—	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 7.5 Electrical Characteristics

Unless otherwise noted the specification applies for  $V_{IN} = 3.6\text{ V}$  over an operating junction temperature of  $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$ . Typical values are for  $T_A = 25^{\circ}\text{C}$ .

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY CURRENT</b>						
$V_{IN}$	Input voltage range		2.5		6	V
	Minimum input voltage for start-up	MODE0 = 1, MODE1 = 1, $R_L = 10\ \Omega$			2.5	V
$I_Q$	Operating quiescent current into AVIN	MODE0 = 1, MODE1 = 1		8.5		mA
$I_{SD}$	Shutdown current into AVIN	MODE0 = 0, MODE1 = 0, $-40^{\circ}\text{C} \leq T_J \leq 85^{\circ}\text{C}$		0.3	3	$\mu\text{A}$
$V_{UVLO}$	Undervoltage lockout threshold	$V_{IN}$ falling		2.3	2.4	V
<b>OUTPUT</b>

## 9 Detailed Description

### 9.1 Overview

The TPS6105x family employs a 2-MHz constant-frequency, current-mode PWM converter to generate the output voltage required to drive high-power LEDs. The device integrates a power stage based on an NMOS switch and a synchronous NMOS rectifier. The device also implements a linear low-side current regulator to control the LED current when the battery voltage is higher than the diode forward voltage.

### 9.2 Functional Block Diagrams

**Figure 12. Functional Block Diagram of TPS6105x**

Functional Block Diagrams (continued)

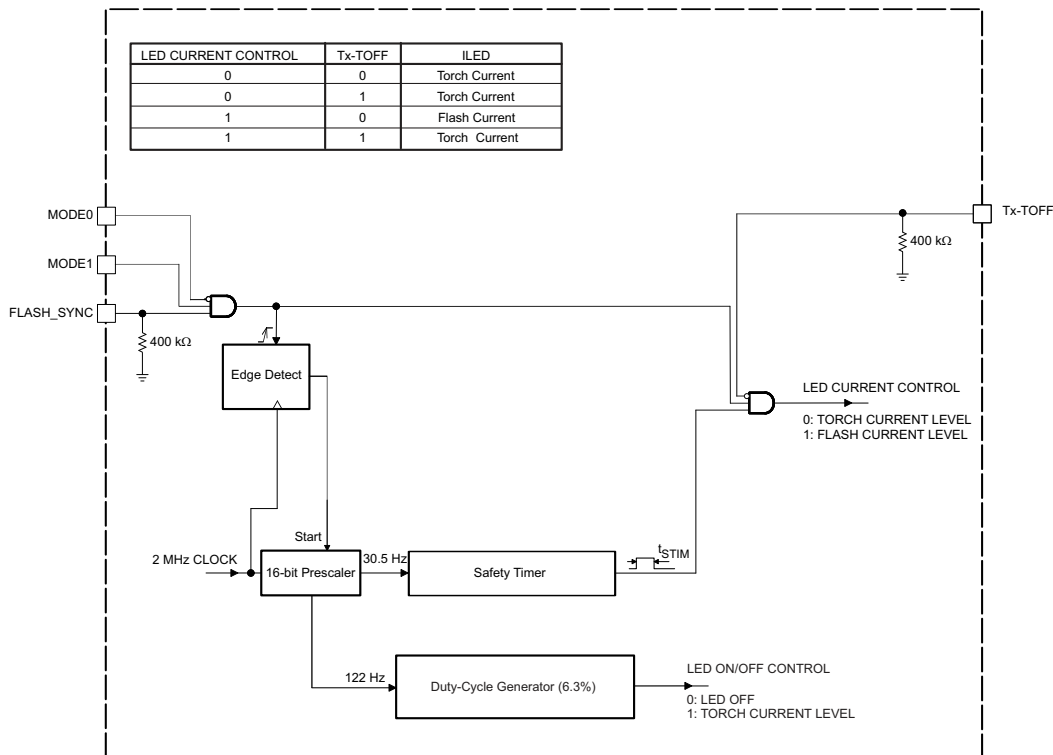

Figure 13. Timer Block Diagram of TPS6105x

9.3 Feature Description

9.3.1 Operation

In boost mode, the duty cycle of the converter is set by the error amplifier and the saw-tooth ramp applied to the comparator. Because the control architecture is based on a current-mode control, a compensation ramp is added to allow stable operation at duty cycles larger than 50%. The converter is a fully-integrated synchronous-boost converter, always operating in continuous-conduction mode. This allows low-noise operation, and avoids ringing on the switch pin, which would be seen on a converter when entering discontinuous-conduction mode.

The TPS6105x device not only operates as a regulated current source but also as a standard voltage-boost regulator. This additional operating mode can be useful to properly synchronize the converter when supplying other high-power devices in the system, such as a hands-free audio power amplifier, or any other component requiring a supply voltage higher than the battery voltage.

The mode of operation (shutdown, torch and flash modes, constant voltage regulation) selection is done through the MODE0/1 control inputs.

Table 2. TPS6105x Operating Modes

MODE1	MODE0	OPERATING MODES
0	0	Power stage is in shutdown. The output is either connected directly to the battery through the body diode of the rectifier.
0	1	LED is turned on for torch light operation. The converter is operating in the current regulation mode (CM). The output voltage is controlled by the forward voltage characteristic of the LED.
1	0	LED is turned on for flashlight operation. The converter is operating in the current regulation mode (CM). The output voltage is controlled by the forward voltage characteristic of the LED.
1	1	LED is turned off and the converter is operating in voltage regulation mode (VM). The output voltage is regulated to 5.0 V.

### 9.3.2 Flash Synchronization

To simplify flash synchronization with the camera module, the device offers a FLASH\_SYNC strobe input pin to switch (with zero latency) the LED current from flash to torch light. The LED is driven at the flashlight current level when a logic high signal is applied to the FLASH\_SYNC pin.

The maximum duration of the flash pulse can be limited by means of an internal safety timer (820 ms). The safety timer starts on the rising edge of the FLASH\_SYNC signal and stops either on its falling edge or after a time-out whatever occurs first.

**Figure 14. Level Sensitive Safety Timer (Time-Out)**

**Figure 15. Level Sensitive Safety Timer (Normal Operation + Time-Out)**

### 9.3.3 Efficiency

The sense voltage has a direct effect on the converter's efficiency. Because the voltage across the low-side current regulator does not contribute to the output power (LED brightness), the lower the sense voltage, the higher the efficiency will be.

When running in boost mode ( $V_{F(LED)} > V_{IN}$ ), the voltage present at the LED pin of the low-side current regulator is typically 250 mV, which contributes to high power-conversion efficiency.

When running in the linear down-converter mode ( $V_{F(LED)} < V_{IN}$ ), the low-side current regulator drops the voltage difference between the input voltage and the LED forward voltage. Depending on the input voltage and the LED forward voltage characteristic, the converter displays efficiency of approximately 80% to 90%.

### 9.3.4 Flash Blanking

The TPS6105x device also integrates a Tx-TOFF input that can be used as flash masking input. This blanking function turns the LED from flash to torch light, thereby reducing almost instantaneously the peak current loading from the battery. This function has no influence on the safety timer duration.

**Figure 16. Synchronized Flash With Blanking Periods (MODE0 = 0, MODE1 = 1)**

### 9.3.5 Soft-Start

Because the output capacitor always remains biased to the input voltage, the TPS6105x can immediately start switching once it has been enabled. The TPS6105x starts up by smoothly ramping up the internal reference voltage of the device, thus limiting the inrush current.

### 9.3.6 Shutdown

In shutdown mode, the regulator stops switching and the LED pin is high-impedance, thus eliminating any DC conduction path. The internal switch and rectifier MOSFET are turned off. VOUT is one body-diode drop below the input voltage and the device consumes only a shutdown current of 0.3  $\mu$ A (typical). The output capacitor remains biased to the input voltage.

### 9.3.7 Undervoltage Lockout

The undervoltage lockout circuit prevents the device from malfunctioning at low input voltages. It prevents the converter from turning on the switch or rectifier MOSFET under undefined conditions.

### 9.3.8 Thermal Shutdown

As soon as the junction temperature,  $T_J$ , exceeds 160°C typical, the device goes into thermal shutdown. In this mode, the *boost* power stage and the low-side current regulator are turned off. To resume operation, the device needs to be cycled through a shutdown phase (MODE0 = 0, MODE1 = 0).

## 9.4 Device Functional Modes

### 9.4.1 Low-Light Dimming Mode

The TPS6105x device features white LED drive capability at very low-light intensity. To generate a reduced LED average current, the device employs a 122-Hz, fixed-frequency PWM modulation scheme. Operation is understood best by referring to the [Figure 13](#).

The torch current is modulated with a 6.3% duty cycle. The low-light dimming mode can only be activated in the torch only mode (MODE1 = 0, MODE0 = 1) together with a logic level high applied to the FLASH\_SYNC input.

Figure 17. PWM Dimming Principle

White LED blinking can be achieved by turning on or off periodically the LED dimmer through the (DIM) bit, see [Figure 18](#).

Figure 18. White LED Blinking Control (MODE1 = 0, FLASH\_SYNC = 1)

### 9.4.2 LED Failure Modes

If the LED fails as a short circuit, the low-side current regulator limits the maximum output current.

If the LED fails as an open circuit, the control loop initially attempts to regulate off of its low-side current regulator feedback signal. This drives VOUT higher. Because the open-circuited LED will never accept its programmed current, VOUT must be voltage-limited by means of a secondary control loop. In this failure mode, the TPS6105x limits VOUT to 6.0 V (typical).

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

The TPS6105x device uses a high-frequency synchronous-boost topology with constant current sink to drive single white LEDs. The TPS6105x device not only operates as a regulated current source, but also as a standard voltage-boost regulator. This additional operating mode can be useful to supply other high-power devices in the system, such as a hands-free audio power amplifier, or any other component requiring a supply voltage higher than the battery voltage.

### 10.2 Typical Applications

#### 10.2.1 High Power White LED Solution Featuring No-Latency Turn-Down through PA TX Signal

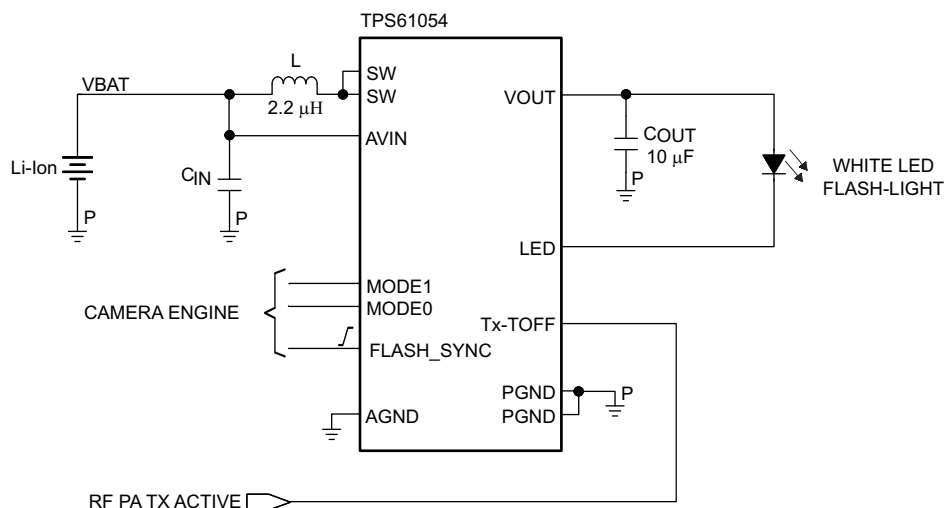

Figure 19. High Power White LED Solution Featuring No-Latency Turn-Down through PA TX Signal

#### 10.2.1.1 Design Requirements

Table 3 shows how to use the TPS6105x to drive high power white LED.

Table 3. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
Input voltage range	3.3 V to 4.2 V
Output voltage	5 V
Flash current	500 mA

#### 10.2.1.2 Detailed Design Procedure

##### 10.2.1.2.1 Inductor Selection

A boost converter requires two main passive components for storing energy during the conversion. A boost inductor and a storage capacitor at the output are required. The TPS6105x device integrates a current limit protection circuitry. The peak current of the NMOS switch is sensed to limit the maximum current flowing through the switch and the inductor (for example, 1000 mA or 1500 mA).

To optimize solution size the TPS6105x device has been designed to operate with inductance values between a minimum of 1.3  $\mu\text{H}$  and maximum of 2.9  $\mu\text{H}$ . In typical high-current white LED applications a 2.2- $\mu\text{H}$  inductance is recommended.

To select the boost inductor, TI recommends to keep the possible peak inductor current below the current limit threshold of the power switch in the chosen configuration. The highest peak current through the inductor and the power switch depends on the output load, the input and output voltages. Estimation of the maximum average inductor current and the maximum inductor peak current can be done using [Equation 1](#) and [Equation 2](#):

$$I_L \approx I_{OUT} = \frac{V_{OUT}}{\eta \times V_{IN}} \quad (1)$$

$$I_{L(PEAK)} = \frac{V_{IN} \times D}{2 \times f \times L} + \frac{I_{OUT}}{(1 - D) \times \eta} \text{ with } D = \frac{V_{OUT} - V_{IN}}{V_{OUT}}$$

where

- f = switching frequency (2 MHz)
  - L = inductance value (2.2  $\mu\text{H}$ )
  - $\eta$  = estimated efficiency (85%)
- (2)

For example, for an output current of 500 mA at 5 V, the TPS6105x device needs to be set for a 1000 mA current limit operation together with an inductor supporting this peak current.

The losses in the inductor caused by magnetic hysteresis losses and copper losses are a major parameter for total circuit efficiency.

**Table 4. List of Inductors**

MANUFACTURER	SERIES	DIMENSIONS	$I_{LIM}$ SETTINGS
TDK	VLF3010AT	2.6 mm × 2.8 mm × 1.0 mm maximum height	1000 mA (typical)
TAIYO YUDEN	NR3010	3.0 mm × 3.0 mm × 1.0 mm maximum height	
FDK	MIPSA2520	2.5 mm × 2.0 mm × 1.2 mm maximum height	
TDK	VLF3014AT	2.6 mm × 2.8 mm × 1.4 mm maximum height	1500 mA (typical)
COILCRAFT	LPS3015	3.0 mm × 3.0 mm × 1.5 mm maximum height	
MURATA	LQH3NP	3.0 mm × 3.0 mm × 1.5 mm maximum height	
TOKO	FDSE0312	3.0 mm × 3.0 mm × 1.2 mm maximum height	

### 10.2.1.2.2 Capacitor Selection

#### 10.2.1.2.2.1 Input Capacitor

For good input voltage filtering low ESR ceramic capacitors are recommended. A 10- $\mu\text{F}$  input capacitor is recommended to improve transient behavior of the regulator and EMI behavior of the total power supply circuit. The input capacitor must be placed as close as possible to the input pin of the converter.

#### 10.2.1.2.2.2 Output Capacitor

The primary parameter necessary to define the output capacitor is the maximum allowed output voltage ripple of the converter. This ripple is determined by two parameters of the capacitor, the capacitance and the ESR. It is possible to calculate the minimum capacitance needed for the defined ripple, supposing that the ESR is zero, by using [Equation 3](#):

$$C_{min} \approx \frac{I_{OUT} \times (V_{OUT} - V_{IN})}{f \times \Delta V \times V_{OUT}}$$

where

- f is the switching frequency
- $\Delta V$  is the maximum allowed ripple.

(3)

With a chosen ripple voltage of 10 mV, a minimum capacitance of 10  $\mu\text{F}$  is needed. The total ripple is larger due to the ESR of the output capacitor. This additional component of the ripple can be calculated using [Equation 4](#):

$$\Delta V_{ESR} = I_{OUT} \times R_{ESR} \tag{4}$$

The total ripple is the sum of the ripple caused by the capacitance and the ripple caused by the ESR of the capacitor. Additional ripple is caused by load transients. This means that the output capacitor has to completely supply the load during the charging phase of the inductor. A reasonable value of the output capacitance depends on the speed of the load transients and the load current during the load change.

For the high current white LED application, a minimum of 3- $\mu$ F effective output capacitance is usually required when operating with 2.2- $\mu$ H (typical) inductors. For solution size reasons, this is usually one or more X5R/X7R ceramic capacitors. For stable operation of the internally compensated control loop, a maximum of 50- $\mu$ F effective output capacitance is tolerable.

Depending on the material, size and margin to the rated voltage of the used output capacitor, degradation on the effective capacitance can be observed. This loss of capacitance is related to the DC bias voltage applied. Therefore, TI always recommends to check that the selected capacitors are showing enough effective capacitance under real operating conditions.

### 10.2.1.2.3 Checking Loop Stability

The first step of circuit and stability evaluation is to look from a steady-state perspective at the following signals:

- Switching node, SW
- Inductor current,  $I_L$
- Output ripple voltage,  $V_{OUT(AC)}$

These are the basic signals that need to be measured when evaluating a switching converter. When the switching waveform shows large duty cycle jitter or the output voltage or inductor current shows oscillations the regulation loop may be unstable. This is often a result of board layout and/or L-C combination.

The next step in regulation loop evaluation is to perform a load transient test. Output voltage settling time after the load transient event is a good estimate of the control loop bandwidth. The amount of overshoot and subsequent oscillations (ringing) indicates the stability of the control loop. Without any ringing, the loop has usually more than 45° of phase margin.

Because the damping factor of the circuitry is directly related to several resistive parameters (for example, MOSFET  $r_{DS(on)}$ ) that are temperature dependant, the loop stability analysis has to be done over the input voltage range, output current range, and temperature range.

### 10.2.2 2 × 350-mA Dual LED Camera Flash

Figure 32 shows the typical application where TPS61054 is used to drive dual LED camera flash (2 × 350-mA).

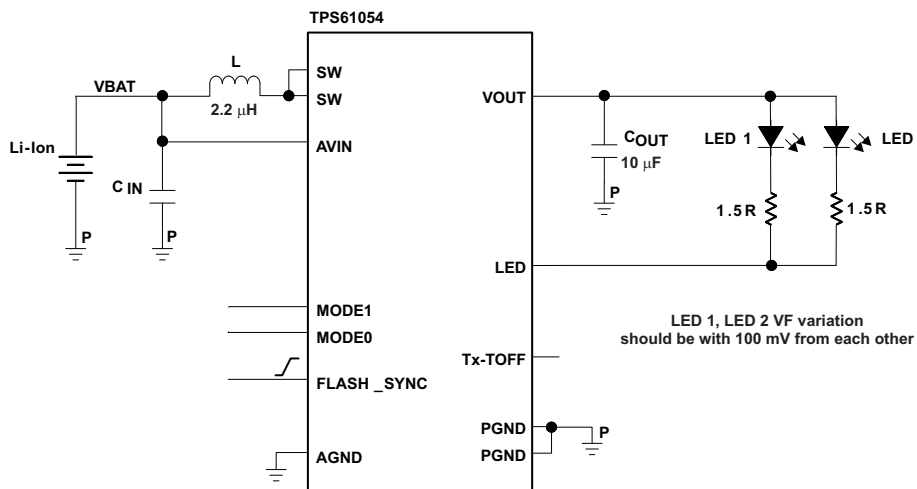

Figure 32. 2 × 350-mA Dual LED Camera Flash

## 11 Power Supply Recommendations

The device is designed to operate from an input voltage supply range between 2.5 V to 6.0 V. This input supply must be well regulated. If the input supply is located more than a few inches from the converter, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. A typical choice is an electrolytic or tantalum capacitor with a value of 47  $\mu$ F.

## 12 Layout

### 12.1 Layout Guidelines

As for all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator could show stability problems as well as EMI problems. Therefore, use wide and short traces for the main current path and for the power ground tracks.

The input capacitor, output capacitor, and the inductor must be placed as close as possible to the IC. Use a common ground node for power ground and a different one for control ground to minimize the effects of ground noise. Connect these ground nodes at any place close to one of the ground pins of the IC.

To lay out the control ground, TI recommends to use short traces, as well, separated from the power ground traces. This avoids ground shift problems, which can occur due to superimposition of power ground current and control ground current.

### 12.2 Layout Example

Figure 33. Typical PCB Layout

## 12.3 Thermal Considerations

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependant issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power-dissipation limits of a given component.

Three basic approaches for enhancing thermal performance are:

- Improving the power dissipation capability of the PCB design
- Improving the thermal coupling of the component to the PCB
- Introducing airflow in the system

Junction-to-ambient thermal resistance is highly application and board-layout dependent. In applications where high maximum power dissipation exists, take special care to thermal dissipation issues in board design. The maximum junction temperature ( $T_J$ ) of the TPS6105x is 150°C.

The maximum power dissipation gets especially critical when the device operates in the linear down mode at high LED current. For single-pulse power thermal analysis (for example, flash strobe), the allowable power dissipation for the device is given by [Figure 34](#).

**Figure 34. Single Pulse Power Capability (CSP Package)**

## 13 Device and Documentation Support

### 13.1 Device Support

#### 13.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

### 13.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

**Table 5. Related Links**

PARTS	PRODUCT FOLDER	SAMPLE & BUY	TECHNICAL DOCUMENTS	TOOLS & SOFTWARE	SUPPORT & COMMUNITY

### 13.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 13.4 Trademarks

NanoFree, E2E are trademarks of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 13.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 13.6 Glossary

**SLYZ022** — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. # THERMAL PAD MECHANICAL DATA

DRC (S-PVSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
