DLPA2000 Power Management and LED/Lamp Driver IC

1 Features

Texas

Instruments

- High Efficiency RGB LED/Lamp Driver with Buck-Boost DC-to-DC Converter, DMD Supplies, DPP Core Supply, 1.8-V Load Switch, and Measurement System in a Small Chip-Scale Package
- Three Low-Impedance (30 m Ω Typical at 27°C) MOSFET Switches for Channel Selection
- Independent, 10-Bit Current Control per Channel
- • 750-mA Max LED Current for DLPA2000 Embedded Applications
- On-Chip Motor Driver
- DMD Regulators
	- Requires Only a Single Inductor
	- VOFS: 10 V
	- VBIAS: 18 V
	- VRST: –14 V
	- Passive Discharge to GND When Disabled
- • DPP 1.1-V Core Supply
	- Synchronous Step-Down Converter with Integrated Switching FETs
	- Supports up to 600-mA Output Current
- • VLED Buck Boost Converter
	- Power Save Mode at Light Load Current
- Low-Impedance Load Switch
	- $-$ V_{IN} Range from 1.8 V to 3.6 V
	- Supports up to 200 mA of Current
	- Passive Discharge to GND When Disabled
- DMD Reset Signal Generation and Power Supply Sequencing
- • 33-MHz Serial Peripheral Interface (SPI)
- • Multiplexer for Measuring Analog Signals
- **Battery Voltage**
- LED Voltage, LED Current
- Light Sensor (for White Point Correction)
- Internal Reference Voltage
- External (Thermistor) Temperature Sensor
- Monitoring and Protection Circuits
	- Hot Die Warning and Thermal
	- Low-Battery Warning
	- Programmable Battery Undervoltage Lockout (UVLO)
	- Load Switch UVLO
	- Overcurrent and Undervoltage Protection
- DLPA2000 DSBGA Package
	- 56-Ball 0.4-mm Pitch
	- Die Size: 3.280 mm × 3.484 mm ± 0.03 mm

2 Applications

DLP™ Display Projector DLP™ Mobile Sensing

3 Description

The DLPA2000 is a dedicated PMIC/RGB LED/lamp driver for the DLP2010 and DLP2010NIR digital micromirror devices (DMD) when used with a DLPC3430, DLPC3435, or DLPC150 digital controller. For reliable operation of these chipsets, it is mandatory to use the DLPA2000.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature (unless otherwise noted)⁽¹⁾

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 Storage Conditions

applicable before the DMD is installed in the final product.

6.3 ESD Ratings

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

DLPS043B –JUNE 2014–REVISED FEBRUARY 2018 **www.ti.com**

ISTRUMENTS

EXAS

6.5 Thermal Information

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](http://www.ti.com/lit/pdf/spra953). Estimated when mounted on high K JEDEC board per JESD 51-7 with thickness of 1.6 mm, 4 layers, size of 76.2 mm × 114.3 mm, and 2-oz. copper for top and bottom plane. Actual thermal impedance will depend on PCB used in the application.

6.6 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted) (see $(1)(2)$)

(1) Fully functional but limited parametric performance

(2) Including rectifying diode
(3) To reduce ripple the C_{OUT}

To reduce ripple the C_{OUT} can be increased. V_{RIPPLE} is inversely proportional to C_{OUT}.

Figure 3. SPI Timing Diagram

6.9 Typical Characteristics

The maximum output current of the buck-boost is a function of input voltage (V_{IN}) and output voltage (V_{LED}). The relationship between V_{IN}, V_{LED}, and MAX I_{LED} is shown in [Figure 4](#page-12-1). Note that V_{LED} is the output of the buck-boost regulator, which includes the voltage drop across the sense resistor $\mathsf{R}_{\mathsf{LIM}}$ (100 mΩ typical), internal strobe control switch (75 mΩ max), and the forward voltage of the LED.

7 Detailed Description

7.1 Overview

The DLPA2000 is a power management and LED driver IC optimized for DLP video and data display systems and meant for use in either embedded or accessory projector applications. DLPA2000 is part of the chipset comprising of either DLP2010 (0.2 WVGA) DMD and DLPC3430/DLPC3435 controller or the DLP2010NIR (0.2 WVGA NIR) DMD and DLPC150 controller. The DLPA2000 contains a complete LED driver including high efficiency power convertors. The DLPA2000 can supply up to 750 mA per LED. Integrated high-current switches are included for sequentially selecting R, G, and B LEDs. The DLPA2000 also contains three regulated DC supplies for the DMD reset circuitry: $\mathsf{V_{BIAS}},\,\mathsf{V_{RST}}$ and $\mathsf{V_{OFS}},$ as well as a regulated DC supply of 1.1 V and a load switch for the 1.8 V to support the DLPC3430 or DLPC3435 controller. The DLPA2000 also contains a motor driver which can be used to drive the focus lens motor. The DLPA2000 has a SPI used for setting the configuration. Using SPI, currents can be set independently for each LED with 10-bit resolution. Other features included are the generation of the system reset, power sequencing, input signals for sequentially selecting the active LED, IC self-protections, and an analog MUX for routing analog information to an external ADC.

7.2 Functional Block Diagram

A. Pin names refer to DLPA2000 pinout

B. Pins connected to 'system power' can be locally decoupled with the capacity as indicated in the block diagram. At least adequate decoupling capacity (50 μF or more) should be connected at the location the supply is entering the board.

[DLPA2000](http://www.ti.com/product/dlpa2000?qgpn=dlpa2000) DLPS043B –JUNE 2014–REVISED FEBRUARY 2018 **www.ti.com**

7.3 Feature Description

7.3.1 DMD Regulators

DLPA2000 contains three switch-mode power supplies that power the DMD. These rails are V_{OFS} , V_{BIAS} , and V_{RST} . After pulling the PROJ_ON pin high, the DMD is first initialized followed by a power-up of the V_{OFS} line after a small delay of less than 10 ms followed by $\rm V_{BIAS}$ and $\rm V_{RST}$ with an additional delay of 145 ms. The LED driver and STROBE DECODER circuit can only be enabled after all three rails are enabled. There are two power-down sequences, the normal power-down timing initiated after pulling the PROJ_ON pin low, and a fast power-down mode where if any one of the rails encounters a fault such as an output short, all three rails are discharged simultaneously. The detailed power-up and power-down diagrams are shown in [Figure 5](#page-15-1) and [Figure 6.](#page-16-0)

NOTE

All values are typical (unless otherwise noted).

Feature Description (continued)

A. If the FAULT condition happens and its associated interrupt is masked in the interrupt mask register (0Dh), the INTZ does not go low, but all other timing shown in the diagram is unaffected.

Figure 6. Power Sequence Fault Shutdown Mode

NOTE

All values are typical (unless otherwise noted).

7.3.2 RGB Strobe Decoder

DLPA2000 contains RGB color-sequential circuitry that is composed of three NMOS switches, the LED driver, the strobe decoder, and the LED current control. The NMOS switches are connected to the terminals of the external LED package and turn the currents through the LEDs on and off. Package connections are shown in [Figure 7](#page-17-0) and [Figure 10](#page-20-0) and the corresponding switch map is in [Table 1.](#page-17-1)

The LED_SEL[1:0] signals typically receive a rotating code switching from RED to GREEN to BLUE and then back to RED. When the LED SEL[1:0] input signals select a specific color, the NMOSFETs are controlled based on the color selected, and a 10-bit current control DAC for this color is selected that provides a control current to the RGB LEDs' feedback control network.

Copyright © 2014–2018, Texas Instruments Incorporated *[Submit Documentation Feedback](http://www.go-dsp.com/forms/techdoc/doc_feedback.htm?litnum=DLPS043B&partnum=DLPA2000)*

Feature Description (continued)

Figure 7. Switch Connection for a Common-Anode LED Assembly

The switching of the three NMOS switches is controlled such that switches are returned to the open position first before the closed connections are made (break before make). The dead time between opening and closing switches is controlled through the BBM register. Switches that already are in the closed position (and are to remain in the closed state according to the SWCNTRL register) are not opened during the BBM delay time.

TIME

Figure 8. BBM Timing (See Register 0Bh in [Figure 27\)](#page-33-0)

7.3.3 LED Current Control

DLPA2000 provides time-sequential circuitry to drive three LEDs with independent current control. A system based on a common anode LED configuration is shown in [Figure 10](#page-20-0) and consists of a buck-boost converter, which provides the voltage to drive the LEDs, three switches connected to the cathodes of the LEDs, an R_{LM} resistor used to sense the LED current, and a current DAC to control the LED current. The voltage measured at the pin $V(RLIM K)$ is used by the regulator loop.

The STROBE DECODER controls the switch positions as described in the previous section (*[RGB Strobe](#page-16-1) [Decoder](#page-16-1)*). With all switches in the open position, the buck-boost output assumes an output voltage of 3.5 V.

For a common-anode RGB LED configuration, the buck-boost output voltage (V_{LED}) assumes a value such that the voltage drop across the sense resistor equals:

$$
(SW4_lDAC[9:0] \text{value} + ILED) \times R_{lIM} \tag{1}
$$

The exact value of VLED depends on the current setting and the voltage drop across the LED but is limited to 5.4 V. When the STROBE decoder switches from SW4 to SW5, the buck-boost assumes a new output voltage such that the sense voltage equals:

$$
(SW5 _IDAC[9:0] _ value + ILED) \times R_{LIM}
$$
\n
$$
(SW6 _IDAC[9:0] _ value + ILED) \times R_{LIM}
$$
\n
$$
(3)
$$

The relationship between V_{IN} , V_{LED} , and MAX I_{LED} is shown in [Figure 4](#page-12-1).

7.3.4 Calculating Inductor Peak Current

To properly configure the DLPA2000 device, a 2.2-µH inductor must be connected between pin L1 and pin L2. The peak current for the inductor in steady state operation can be calculated.

[Equation 4](#page-18-0) shows how to calculate the peak current I₁ in step down mode operation, and [Equation 5](#page-18-1) shows how to calculate the peak current I₂ in boost mode operation. V_{IN1} is the maximum input voltage, V_{IN2} is the minimum input voltage, f is the switching frequency (2.25 MHz), and L the inductor value (2.2 μ H).

$$
I_1 = \frac{I_{OUT}}{0.8} + \frac{V_{OUT}(V_{IN1} - V_{OUT})}{2 \times V_{IN1} \times f \times L}
$$

\n
$$
I_2 = \frac{V_{OUT} \times I_{OUT}}{0.8 \times V_{IN2}} + \frac{V_{IN2}(V_{OUT} - V_{IN2})}{2 \times V_{OUT} \times f \times L}
$$

\n(4)

The critical current value for selecting the right inductor is the higher value of I_1 and I_2 . Also consider that load transients and error conditions may cause higher inductor currents. This needs to be accounted for when selecting an appropriate inductor. Internally the switching current is limited to a maximum of 4 A.

7.3.5 LED Current Accuracy

The LED drive current is controlled by a current digital-to-analog converter (DAC) and can be set independently for switch SW4, SW5, and SW6. The DAC is trimmed at a current of 750 mA for the DLPA2000 at code: 0x307h. The DLPA2000 current step size is 0.95 mA.

First order gain-error of the DAC can be neglected, but an offset current error must be taken into account. This offset error differs depending on the used R_{LIM} and will be ±25 mA for the DLPA2000 for a 100-m Ω current sense resistor.

The max current of the DLPA2000 (SWx IDAC[9:0] = 0x307h) is regulated to 750 mA. At the lowest setting (SWx_IDAC[9:0] = 0x001h) the current is regulated to 14 mA for the DLPA2000. For this current setting (0x001h), the absolute current error results into a large relative error; however, this is not a typical operating point.

Be aware that the LED current setting not only depends on the accuracy of the R_{LM} resistor, but also strongly depends on the added resistance of PCB traces and soldering quality. Due to the low value of the current sense resistor R_{LIM}, any extra introduced resistance (for example several mΩ) will result in a noticeable different LED current.

[DLPA2000](http://www.ti.com/product/dlpa2000?qgpn=dlpa2000)

DLPS043B –JUNE 2014–REVISED FEBRUARY 2018 **www.ti.com**

7.3.6 Transient Current Limiting

Typically the forward voltages of the green and blue diodes are close to each other (about 3 V to 4 V). However, the forward voltage of the red diode is significantly lower (1.8 V to 2.5 V). This can lead to a current spike in the red diode when the strobe controller switches from green or blue to red because VLED is initially at a higher voltage than required to drive the RED diode. DLPA2000 provides transient current limiting for each switch to limit the current in the LEDs during the transition. The transient current limit value is controlled through the ILIM[3:0] bits in the IREG register. The same register also contains three bits to select which switch employs the transient current limiting feature. In a typical application, the transient current limit will only apply to the RED diode, and the ILIM[3:0] value will typically be set approximately 10% higher than the DC regulation current. The effect that the transient current limit has on the LED current is shown in [Figure 9.](#page-19-0)

Red LED current without transient current limit. The current overshoots because the buck-boost voltage starts at the (higher) level of the green or blue LED.

LED current with transient current limit.

Figure 9. RED LED Current With and Without Transient Current Limit

Figure 10. LED Driver Block Diagram

7.3.7 1.1-V Regulator (Buck Converter)

The buck converter creates a voltage of 1.1 V, and due to its switching nature, an output ripple with a frequency of approximately 2.25 MHz occurs on its output. This ripple is strongly dependent on the decoupling capacitor at the output in combination with the inductor. The magnitude of the ripple can be calculated with [Equation 6](#page-20-1).

$$
\Delta V_{\text{CORE}} = V_{\text{CORE}} \times \frac{1 - \frac{V_{\text{CORE}}}{V_{\text{INC}}}}{L \times f} \times \left(\frac{1}{8 \times C_{\text{OUT}} \times f} + \text{ESR}\right)
$$

The best way to minimize this ripple is to select a capacitor with a very-low ESR.

(6)

DLPS043B –JUNE 2014–REVISED FEBRUARY 2018 **www.ti.com**

7.3.8 Motor Driver

Two control modes are available in the DLPA2000: IN/IN mode and PHASE/ENABLE mode. IN/IN mode is selected if the MODE pin is driven low or left unconnected; PHASE/ENABLE mode is selected if the MODE pin is driven to logic high. [Table 2](#page-21-0) and [Table 3](#page-21-1) show the logic for these modes.

The main difference between both modes is that to change the rotation direction for IN/IN mode, both xIN1 and xIN2 signals must change polarity, while for PHASE/ENABLE mode, the PHASE signal must be held high while the PHASE signal is used to change rotation direction for a DC motor. In case a stepper motor is used, the sequence of OUT1 and OUT2 determines the rotation direction.

The motor position is changed by using the internal, register-generated, control signals AIN1 and AIN2 (register 0F[123:122] in combination with BIN1 and BIN2 (register 0F[121:120].

Table 2. IN/IN Mode (See [Figure 31](#page-37-0))

Table 3. PHASE/ENABLE Mode (See [Figure 31](#page-37-0))

7.3.8.1 Motor Driver Overcurrent Protection

An analog current limit circuit on each FET limits the current through the FET by removing the gate drive. If this analog current limit persists for a longer period of time than the overcurrent deglitch time, all FETs in the Hbridge will be disabled. After approximately 1 ms, the bridge will be re-enabled automatically.

7.3.9 Measurement System

The measurement system is composed of a 10:1 analog multiplexer (MUX), a programmable-gain amplifier, and a comparator. It works together with the DPP processor to provide:

- White-point correction (WPC) by independently adjusting the RGB LED currents after measuring the brightness of each color with an external light sensor
- A measurement of the:
	- Battery voltage
	- LED forward voltage
	- Exact LED current
	- Temperature as derived by measuring the voltage across an external thermistor

[Figure 11](#page-22-0) shows a block diagram of the measurement system.

7.3.10 Protection Circuits

DLPA2000 has several protection circuits to protect the IC and system from damage due to excessive power consumption, die temperature, or over-voltages. These circuits are described in the following sections.

7.3.10.1 Thermal Warning (HOT) and Thermal Shutdown (TSD)

DLPA2000 continuously monitors the junction temperature and issues a HOT interrupt if temperature exceeds the HOT threshold. If the temperature continues to increase above the thermal shutdown threshold, all rails are disabled and the TSD bit in the INT register is set. After the temperature drops below its threshold, the system recovers and waits for the DPP to resend the DMD_EN bit.

Figure 12. Definition of the Thermal Shutdown and Hot-Die Temperature Warning

7.3.10.2 Low Battery Warning (BAT_LOW) and Undervoltage Lockout (UVLO)

If the battery voltage drops below the BAT_LOW threshold (typically 3.0 V) the BAT_LOW interrupt is issued, but normal operation continues. After the battery drops below the undervoltage threshold which has a default hardcoded value of 2.3 V (this UVLO voltage can be changed through register 09h from 2.3 V to 4.5 V), the UVLO interrupt is issued, all rails are powered down in sequence, the DMD_EN bit is reset, and the part enters STANDBY mode. The power rails cannot be re-enabled before the input voltage recovers to >2.4 V. To re-enable the rails, the PROJ_ON pin must be toggled. The undervoltage threshold is programmable from 2.3 V to 4.5 V in 31 steps.

The UVLO shutdown process will protect the DMD by allowing time for the mirrors to park, then doing a fast discharge of V_{OFS} , V_{RST} , and V_{BIAS} . This protection occurs even in the case of sudden battery removal from the projector, as long as the bulk capacitance on the battery voltage (V_{INx}) keeps this voltage above 2.3 V for as long as needed for V_{OFS} , V_{RST} , and V_{BIAS} to discharge to the required safe levels as shown in the DMD data sheet. V_{OFS}, V_{RST}, and V_{BIAS} discharge times depend on the load capacitance on each regulator. When for instance every supply is decoupled using a capacitor of 0.5 μ F, V_{INx} should stay above 2.3 V for at least 100 μ s after the battery is suddenly removed. During this time, the mirrors can be placed in a safe position and V_{OFS} , V_{RST} , and V_{BIAS} can be discharged.

NOTE

As required by the DMD data sheet, LS OUT must stay above 1.65 V until V_{OFS} , V_{RST}, and V_{BIAS} have discharged to their required safe levels.

A. This time is programmable from 0 to 100 us.

Figure 13. UVLO is Asserted When the Input Supply Drops Below the UVLO Threshold

7.3.10.3 DMD Regulator Fault (DMD_FLT)

The DMD regulator is continuously monitored to check if the output rails are in regulation and if the inductor current increases as expected during a switching cycle. If either one of the output rails drops out of regulation (for example, due to a shorted output) or the inductor current does not increase as expected during a switching cycle (due to a disconnected inductor), the DMD_FLT interrupt bit is set in the INT register, the DMD_EN bit is reset, and the DMD regulator is shut down. Resetting the DMD_EN bit also causes the LED driver to power down. To restart the system, the PROJ_ON pin must be toggled. In case the interrupt is masked, it is sufficient to set the DMD EN bit to restart the system.

7.3.10.4 V6V Power-Good (V6V_PGF) Fault

The LED driver regulation loop requires the V_{6V} rail for proper operation. The rail is continuously monitored and should the output drop below the power-good threshold, the $V_{6V\text{ PGF}}$ bit is set. The V_{LED} buck-boost is then disabled and attempts to restart automatically.

7.3.10.5 VLED Overvoltage (VLED_OVP) Fault

If the buck-boost output voltage rises above 5.4 V, the $V_{LED\ OVP}$ interrupt is set but the buck-boost regulator is not turned off. A typical condition to cause this fault is an open LED.

7.3.10.6 VLED Power Save Mode

In normal PWM operation, the efficiency of the V_{LED} buck-boost converter dramatically reduces for LED currents below 100 mA. In this case, the power save mode allows high converting efficiency at low output currents by skipping pulses in the switcher's gate driver control.

7.3.10.7 V1V8 PG Failure

If for any reason the voltage on the LS_OUT drops below approximately 1.3 V, then V_{OFS} , V_{BIAS} , and V_{RST} immediately go into fast shut down. Holding off power down to do mirror parking is not included since 1.3 V is too low to wait for this. Reactivating can only be done by toggling the PROJ ON off and on again.

7.3.10.8 Interrupt Pin (INTZ)

The interrupt pin is used to signal events and fault conditions to the host processor. Whenever a fault or event occurs in the IC, the corresponding interrupt bit is set in the INT register, and the open-drain output is pulled low. The INTZ pin is released (returns to HiZ state) and fault bits are cleared when the INT register is read by the host.

However, if a failure persists, the corresponding INT bit remains set and the INTZ pin is pulled low again after a maximum of 32 µs.

Copyright © 2014–2018, Texas Instruments Incorporated *[Submit Documentation Feedback](http://www.go-dsp.com/forms/techdoc/doc_feedback.htm?litnum=DLPS043B&partnum=DLPA2000)*

Interrupt events include fault conditions such as power-good faults, over-voltage, over-temperature shutdown, and UVLO. For all interrupt conditions see the interrupt register on [Figure 28.](#page-34-0)

The MASK register is used to mask events from generating interrupts, that is, from pulling the INTZ pin low. The MASK settings affect the INTZ pin only and have no impact on protection and monitor circuits themselves. When an interrupt is masked, the event causing the interrupt still sets the corresponding bit in the INT register. However, it does not pull the INTZ pin low.

7.3.10.9 SPI

DLPA2000 provides a 4-wire SPI port that supports high-speed serial data transfers up to 33.3 MHz. Support includes register and data buffer write and read operations. The SPI_CSZ input serves as the active low chip select for the SPI port. The SPI_CSZ input must be forced low in order to write or read registers and data buffers. When SPI_CSZ is forced high, the data at the SPI_DIN input is ignored, and the SPI_DOUT output is forced to a high-impedance state. The SPI_DIN input serves as the serial data input for the port; the SPI_DOUT output serves as the serial data output. The SPI_CLK input serves as the serial data clock for both the input and output data. Data is latched at the SPI_DIN input on the rising edge of SPI_CLK, while data is clocked out of the SPI_DOUT output on the falling edge of SPI_CLK. [Figure 14](#page-25-0) shows the SPI port protocol. Byte 0 is referred to as the command byte, where the most significant bit is the write/not read bit. For the W/nR bit, a 1 indicates a write operation, while a 0 indicates a read operation. The remaining seven bits of the command byte are the register address targeted by the write or read operation. The SPI port supports write and read operations for multiple sequential register addresses through the implementation of an auto-increment mode. As shown in [Figure 14](#page-25-0), the auto-increment mode is invoked by simply holding the SPI_CSZ input low for multiple data bytes. The register address is automatically incremented after each data byte transferred, starting with the address specified by the command byte. After reaching address 0x7Fh the address pointer jumps back to 0x00h.

7.3.11 Password Protected Registers

Register addresses 0x11h through 0x27h can be read-accessed the same way as any other register, but are protected against accidental write operations through the PASSWORD register (address 0x10h). To write to a protected register, follow these steps:

- 1. Write data 0xBAh to register address 0x10h.
- 2. Write data 0xBEh to register address 0x10h.

Both writes must be consecutive, that is, there must be no other read or write operation in between sending the two bytes. After the password has been successfully written, registers 0x11h through 0x27h are unlocked and can be write accessed using the regular SPI protocol. They remain unlocked until any byte other than 0xBAh is written to the PASSWORD register or the part is power cycled.

To check if the registers are unlocked, read back the PASSWORD register. If the data returned is 0x00h, the registers are locked. If the PASSWORD register returns 0x01h, the registers are unlocked.

7.4 Device Functional Modes

Table 5. Modes of Operation

(1) Settings can be done through Reg01h [9] and Reg2E [119].

Power-good faults, over-voltage, overtemperature shutdown, and undervoltage lockout.

(2) Power-good faults, over-voltage, overtemperature shutdown, and unde
(3) Settings can be done through Reg47h [60], bit is named $V_{LED_EN_SET}$.

Table 6. Device State as a Function of Control-Pin Status

- A. $|| = OR, 8 = AND$.
- B. FAULT = Undervoltage on any supply (except LS_OUT), thermal shutdown, or UVLO detection.
- C. UVLO detection, per the diagram, causes the DLPA2000 to go into the standby state. This is not the lowest power state. If lower power is desired, PROJ_ON should be set low.
- D. DMD_EN register bit can be reset or set by SPI writes. DMD_EN defaults to 0 when PROJ_ON goes from low to high and then the DPP ASIC software automatically sets it to 1. Also, FAULT = 1 causes the DMD_EN register bit to be reset.
- E. PWR_EN is a signal internal to the PAD200x. This signal turns on the VCORE regulator and the load switch that drives pin LS_OUT.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

A DLPC343x controller can be used with a DLP2010 (0.2 WVGA) DMD or DLP3010 (0.3 720p) DMD to provide a compact, reliable, high-efficiency display solution for many different video display applications. The DMDs are spatial light modulators which reflect incoming light from an illumination source to one of two directions with the primary direction being into collection optics within a projection lens. The projection lens sends the light to the destination needed for the application. Each application is derived primarily from the optical architecture of the system and the format of the pixel data being input into the DLPC343x.

In display applications using the DLP2010 DMD or DLP3010 DMD, the DLPA2000 provides all needed analog functions including the analog power supplies and the RGB LED driver to provide a robust and efficient display solution. Display applications of interest include pico-projectors embedded in display devices like smart phones, tablets, cameras, and camcorders. Other applications include wearable (near-eye) displays, battery-powered mobile accessories, interactive displays, low latency gaming displays, and digital signage.

Alternately, a DLPC150 controller can be used with a DLP2010 or DLP2010NIR DMD. Applications of interest when using the DLPC150 controller include machine vision systems, spectrometers, skin analysis, medical systems, material identification, chemical sensing, infrared projection, and compressive sensing. In a spectroscopy application the DLPC150 controller and DLP2010NIR DMD are often combined with a single element detector to replace expensive InGaAs array-based detector designs. In this application the DMD acts as a wavelength selector reflecting specific wavelengths of light into the single point detector.

8.2 Typical Projector Application

A common application when using DLPA2000 with DLP2010 DMD and DLPC3430 controller is for creating a pico-projector embedded in a handheld product. For example, a pico-projector may be embedded in a smart phone, a tablet, a camera, or camcorder. The DLPC3430 in the pico-projector embedded module typically receives images from a host processor within the product as shown in [Figure 42](#page-40-3). DLPA2000 provides power supply sequencing and controls the LED currents as required by the application.

Typical Projector Application (continued)

8.2.1 Design Requirements

A pico-projector is created by using a DLP chipset comprised of DLP2010 (0.2 WVGA) DMD, DLPC3430, or DLPC3435 controller and DLPA2000 PMIC/LED driver. The DLPC3430 or DLPC3435 does the digital image processing, the DLPA2000 provides the needed analog functions for the projector, and DMD is the display device for producing the projected image.

In addition to the three DLP chips in the chipset, other chips may be needed. At a minimum, a flash part is needed to store the software and firmware to control the DLPC3430 or DLPC3435.

The illumination light that is applied to the DMD is typically from red, green, and blue LEDs. These are often contained in three separate packages, but sometimes more than one color of LED die may be in the same package to reduce the overall size of the pico-projector.

When connecting the DLPC3430 or DLPC3435 to the host processing to receive images, a parallel interface is used. While using the parallel interface, I²C should be connected to the host processor for sending commands to the DLPC3430 or DLPC3435.

The only power supplies needed external to the projector are the battery (SYSPWR) and a regulated 1.8-V supply. The entire pico-projector can be turned on and off by using a single signal called PROJ ON. When PROJ_ON is high, the projector turns on and begins displaying images. When PROJ_ON is set low, the projector turns off and draws just microamps of current on SYSPWR. When PROJ ON is set low, the 1.8-V supply can continue to be left at 1.8 V and used by other non-projector sections of the product. If PROJ_ON is low, the DLPA2000 will not draw current on the 1.8-V supply.

8.2.2 Detailed Design Procedure

For connecting together the DLP2010, DLPC3430 or DLPC3435, and DLPA2000, see the reference design schematic. When a circuit board layout is created from this schematic, a very small circuit board is possible. An example small board layout is included in the reference design database. Layout guidelines should be followed to achieve a reliable projector.

The optical engine that has the LED packages and the DMD mounted to it is typically supplied by an optical OEM who specializes in designing optics for DLP projectors.

A miniature stepper motor can optionally be added to the optical engine for creating a motorized focus. Direct control and driving of the motor can be done by the DLPA2000, and software commands sent over I²C to the DLPC3430 or DLPC3435 are available to move the motor to the desired position.

Typical Projector Application (continued)

8.2.3 Application Curve

As the LED currents that are driven time-sequentially through the red, green, and blue LEDs are increased, the brightness of the projector increases. This increase is somewhat non-linear, and the curve for typical white screen lumens changes with LED currents is as shown in [Figure 43.](#page-42-2) For the LED currents shown, it is assumed that the same current amplitude is applied to the red, green, and blue LEDs.

Figure 43. Luminance vs Current

8.3 Typical Mobile Sensing Application

A typical embedded system application using the DLPC150 controller and the DLPC2010NIR is shown in [Figure 44](#page-43-0). In this configuration, the DLPC150 controller supports a 24-bit parallel RGB input, typical of LCD interfaces, from an external source or processor. The DLPC150 controller processes the digital input image and converts the data into the format needed by the DLP2010NIR. The DLP2010NIR steers light by setting specific micromirrors to the *on* position, directing light to the detector, while unwanted micromirrors are set to the *off* position, directing light away from the detector. The microprocessor sends binary images to the DLP2010NIR to steer specific wavelengths of light into the detector. The microprocessor uses an analog-to-digital converter to sample the signal received by the detector into a digital value. By sequentially selecting different wavelengths of light and capturing the values at the detector, the microprocessor can then plot a spectral response to the light.

Typical Mobile Sensing Application (continued)

Figure 44. Typical Application Diagram

8.3.1 Design Requirements

All applications using the DLP 0.2-inch WVGA chipset require the:

- DLPC150 controller, and
- DLPA2000 PMIC, and
- DLP2010 or DLP2010NIR DMD

components for operation. The system also requires an external parallel flash memory device loaded with the DLPC150 configuration and support firmware. DLPC150 does the digital image processing and formats the data for the DMD. DLPA2000 PMIC provides the needed analog functions for the DLPC150 and DLP2010 or DLP2010NIR. The chipset has several system interfaces and requires some support circuitry. The following interfaces and support circuitry are required:

- DLPC150 system interfaces:
	- Control interface
	- Trigger interface
	- Input data interface
	- Illumination interface
- DLPC150 support circuitry and interfaces:
	- Reference clock
	- PLL
	- Program memory flash interface
- DMD interfaces:
	- DLPC150 to DMD digital data
	- DLPC150 to DMD control interface
	- DLPC150 to DMD micromirror reset control interface

Typical Mobile Sensing Application (continued)

8.3.2 Detailed Design Procedure

8.3.2.1 Dlpc150 System Interfaces

The 0.2-inch WVGA chipset supports a 16-bit or 24-bit parallel RGB interface for image data transfers from another device. There are two primary output interfaces: Illumination driver control interface and sync outputs.

8.3.2.1.1 Control Interface

The 0.2-inch WVGA chipset supports I^2C commands through the control interface. The control interface allows another master processor to send commands to the DLPC150 controller to query system status or perform realtime operations, such as LED driver current settings.

8.3.3 Application Curve

In a reflective spectroscopy application, a broadband light source illuminates a sample and the reflected light spectrum is dispersed onto the DLP2010NIR. A microprocessor in conjunction with the DLPC150 controls individual DLP2010NIR micromirrors to reflect specific wavelengths of light to a single point detector. The microprocessor uses an analog-to-digital converter to sample the signal received by the detector into a digital value. By sequentially selecting different wavelengths of light and capturing the values at the detector, the microprocessor can then plot a spectral response to the light. This systems allows the measurement of the collected light and derive the wavelengths absorbed by the sample. This process leads to the absorption spectrum shown in [Figure 45](#page-44-0).

Figure 45. Sample DLPC150 Based Spectrometer Output

9 Power Supply Recommendations

The DLPA2000 is designed to operate from a 2.3-V to 6-V input voltage supply or battery. To avoid insufficient supply current due to line drop, ringing due to trace inductance at the V_{IN} terminal, or supply peak current limitations, additional bulk capacitance may be required. In the case ringing that is caused by the interaction with the ceramic input capacitors, an electrolytic or tantalum type capacitor may be needed for damping. The amount of bulk capacitance required should be evaluated such that the input voltage can remain in specification long enough for a proper fast shutdown to occur for the V_{OFS} , V_{RST} , and V_{BIAS} supplies. The shutdown begins when the input voltage drops below the programmable UVLO threshold such as when the external power supply or battery supply is suddenly removed from the system.

10 Layout

10.1 Layout Guidelines

As for all chips with switching power supplies, the layout is an important step in the design, especially in the case of high peak currents and high switching frequencies. If the layout is not carefully done, the regulators could show stability problems as well as EMI problems. Therefore, use wide and short traces for the main current paths and for the power ground tracks. Input capacitors, output capacitors, and inductors should be placed as close as possible to the IC.

[Figure 46](#page-47-1) shows an example layout that has critical parts placed as close as possible to the pins they are connected to. Here are recommendations for the following components:

- R1 is R_{LM} and is connected via a wide trace and as short as possible to the DLPA2000 and the ground.
- L1 is the big inductor for the V_{LED} that is connected via two wide traces to the pins.
- C3/C4 are the decoupling capacitors for the V_{LED} and they are as close as possible placed to the part and directly connected to ground.
- L3/C20 are components used for the V_{CORE} BUCK. L3 is placed close to the pin and connected with a wide trace to the part. C20 is placed directly beside the inductor and connected to the PGND pin.
- L2 This inductor is part of the DMD reset regulators and is also placed as close as possible to the DLPA2000 using wide PCB traces.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

- Insertion of device –The device is located such as symbolization in upper side and lead pins in lower side.
- Cover tape The cover tape does not cover the index hole and does not shift to outside from carrier tape.
- Tape Structure –The carrier tape is made of plastic and the structure is shown in above schematic. The device is put on embossed area of carrier tape, and covered by cover tape made of plastic.
- ESD Countermeasure Plastic material used in both carrier tape and cover tape are static dissipative.
- Material Polycarbonate, Polystyrene or and approved equivalent (Static Dissipative / Antistatic).
- Packing method The reel is packed into Moisture Barrier bag and fastened by heat-sealing after fixed the end of leader tape by tape. The QFN device packing includes desiccant, humidity indicator.
- Reel Box Each Moisture Barrier bag is packed into reel box.

- Reel Box Material Corrugated Fiberboard
- Shipping Box –The filler such as cushion is added if space exists inside. The size of shipping box will be changed per packing quantity of reel box.

Shipping box (carton)

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.

EXAMPLE BOARD LAYOUT

YFF0056 DSBGA - 0.625 mm max height

DIE SIZE BALL GRID ARRAY

NOTES: (continued)

3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. For more information, see Texas Instruments literature number SBVA017 (www.ti.com/lit/sbva017).

EXAMPLE STENCIL DESIGN

YFF0056 DSBGA - 0.625 mm max height

DIE SIZE BALL GRID ARRAY

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](https://www.ti.com/legal/termsofsale.html) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
