

CMOS LOW VOLTAGE, LOW CHARGE INJECTION QUAD SPST ANALOG SWITCHES

GENERAL DESCRIPTION

The ALD4201/ALD4202M are quad SPST CMOS analog switches specifically developed for 3 to 12 volt applications where low charge injection and low leakage currents are important analog switch operating characteristics. The main features are precision matching, charge compensation circuitry, fast switching, low on-resistance and micropower consumption. The ALD4201 operates in break-before-make switching whereas the ALD4202M operates in make-before-break switching.

The ALD4201/ALD4202M are designed for precision applications such as charge amplifiers, sample and hold amplifiers, data converter switches, and programmable gain amplifiers. These switches are also excellent for general purpose switching applications for micropower battery operated systems.

APPLICATIONS INFORMATION

The ALD4201/ALD4202M are designed to operate with standard single or dual power supplies of +3V to 10V or $\pm 1.5V$ to $\pm 5V$. Functionality extends down to +2V or $\pm 1V$ power supply, making it suitable for lithium battery or rechargeable battery operated systems where power efficiency and performance are important design parameters. These switches feature nA quiescent current and interface directly to CMOS logic levels from microprocessor or logic interface circuits. Built-in level shifters at the input stage provide for dual supply analog signal switching. On the board level, low charge injection and fast operation can be obtained by using short leads, minimizing input and output capacitances, and by adequate bypass capacitors placed on the board at the supply nodes. For more information, see Application Note AN4200.

The ALD4201/4202M are manufactured with Advanced Linear Devices' enhanced ACMOS silicon gate CMOS process, and are also part of the linear elements in Advanced Linear Devices' "Function-Specific" ASIC.

LOGIC TABLE

Input Logic	Switch State	
	ALD4201	ALD4202M
0	On	Off
1	Off	On

* Contact factory for industrial temperature range.

FEATURES

- 3V, 5V & 10V supply operation
- $\pm 1.5V$, $\pm 2.5V$ & $\pm 5V$ supply operation
- 0.1 μW power dissipation
- 1pC charge injection
- Rail-to-rail signal range
- Low on-resistance
- pA leakage current
- 4201 break-before-make switching
- 4202M make-before-break switching
- Built-in dual supply level translator

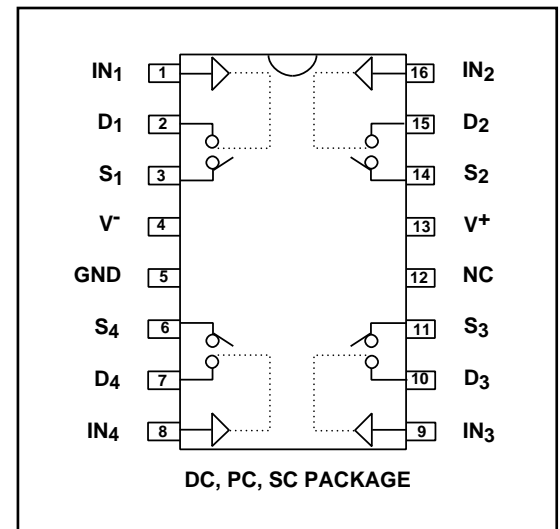

BENEFITS

- Fast effective signal throughput
- Low switching transients
- Low signal loss
- Essentially no DC power consumption
- Full analog signal range over power supply rail
- Flexible power supply range for battery operated systems

APPLICATIONS

- Low level signal conditioning circuits
- Portable battery operated instruments
- Computer peripherals
- PCMCIA
- Fast sample and hold
- Analog signal multiplexer
- Programmable gain amplifiers
- Switched capacitor circuits
- Micropower based systems
- Video/audio switches
- Feedback control systems

PIN CONFIGURATION / BLOCK DIAGRAM

ABSOLUTE MAXIMUM RATINGS

Supply voltage, V+ referenced to V-	_____	-0.3V to +13.2V
GND	_____	-0.3V to +13.2V
Terminal voltage range (any terminal) Note 1	_____	(V- -0.3)V to (V+ +0.3)V
Power dissipation	_____	600 mW
Operating temperature range	PC, SC package _____	0°C to +70°C
	DC package _____	-55°C to +125°C
Storage temperature range	_____	-65°C to +150°C
Lead temperature, 10 seconds	_____	+260°C
DC current (any terminal)	_____	10mA

POWER SUPPLY RANGE

Parameter	Symbol	4201/4202M (PC,SC)			4201/4202M (DC)			Unit

DC ELECTRICAL CHARACTERISTICS

$T_A = 25^\circ\text{C}$ $V_+ = +5.0\text{V}$, $V_- = \text{GND} = 0.0\text{V}$ unless otherwise specified

Parameter	Symbol	ALD4201/4202M (PC,SC)			ALD4201/4202M (DC)			Unit	Test Conditions
		Min	Typ	Max	Min	Typ	Max		
Analog Signal Range	V_A	0.0		+5.0	0.0		+5.0	V	
On - Resistance	R_{ON}		195 240	280 350		195 270	280 390	Ω	$V_A = +2.5\text{V}$ $I_A = 1\text{mA}$ 0°C to $+70^\circ\text{C}$ -55°C to $+125^\circ\text{C}$
Change of On-Resistance from - V_S to $+V_S$	ΔR_{ON}		20			20		%	
Change of On-Resistance with Temperature	$\Delta R_{\text{ON}}/\Delta T$		0.43			0.43		%/ $^\circ\text{C}$	
R_{ON} Match Between Switches			2			2		%	
Input High Voltage	V_{IH}	4.0			4.0			V	
Input Low Voltage	V_{IL}			0.8			0.8	V	

Notes:

1. Voltage on any terminal must be less than $(V_+) + 0.3\text{V}$ and greater than $(V_-) - 0.3\text{V}$, at all times including before power is applied and $V_+ = V_- = 0.0\text{V}$. Vsupply power supply needs to be sequenced on first on power turn-on and sequenced off last during power turn-off.
2. See Switching Time Test Circuit.
3. Guaranteed by design.
4. See Charge Injection Test Circuit.
5. See Off Isolation Test Circuit.
6. See Crosstalk Test Circuit.

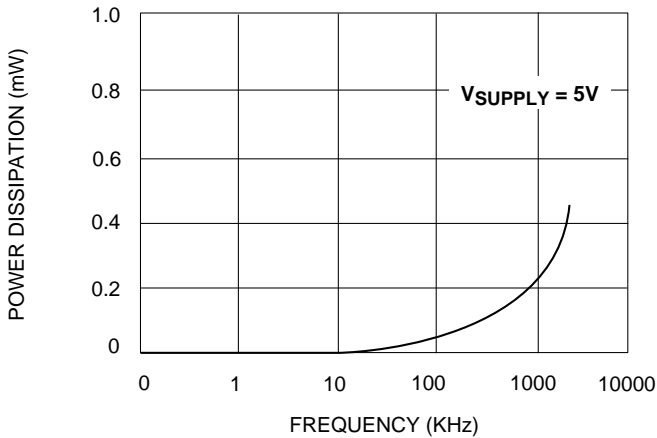

DC ELECTRICAL CHARACTERISTICS

$T_A = 25^\circ\text{C}$ $V_+ = +3.0\text{V}$, $V_- = \text{GND} = 0.0\text{V}$ unless otherwise specified
