

# Micropower, Single-Supply, Rail-to-Rail Precision Differential Amplifiers

## General Description

The MAX4198/MAX4199 low-power, rail-to-rail differential amplifiers are ideal for single-supply applications that benefit from a low 0.01% gain error. The MAX4198 is factory trimmed to a fixed gain of +1V/V, and the MAX4199 is trimmed to a fixed gain of +10V/V. Capable of operating from a single +2.7V to +7.5V supply or from dual  $\pm 1.35V$  to  $\pm 3.75V$  supplies, they consume only 42 $\mu A$  while achieving -3dB bandwidths of 175kHz (MAX4198) and 45kHz (MAX4199). These amplifiers feature a shutdown mode that reduces the supply current to 6.5 $\mu A$ .

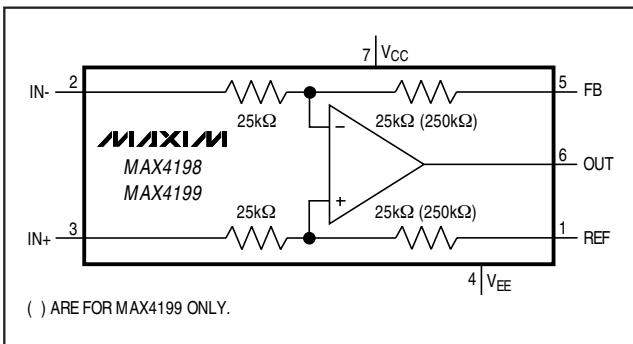

The MAX4198/MAX4199 can drive 5k $\Omega$  loads to within 100mV from each rail. The standard differential amplifier configurations provide common-mode rejection of 90dB for the MAX4198 and 110dB for the MAX4199. The input common-mode voltage range for the MAX4198 extends 100mV Beyond-the-Rails™.

The MAX4198/MAX4199 are offered in a space-saving 8-pin  $\mu$ MAX package. For complete micropower, rail-to-rail instrumentation amplifiers, see the MAX4194–MAX4197 data sheet.

## Applications

- Instrumentation Amplifier Building Block
- Differential Voltage Amplifiers
- Data-Acquisition Systems
- Portable/Battery-Powered Equipment
- Transducer Interface
- Current-Sense Amplifiers

## Functional Diagram

Beyond-the-Rails is a trademark of Maxim Integrated Products, Inc.

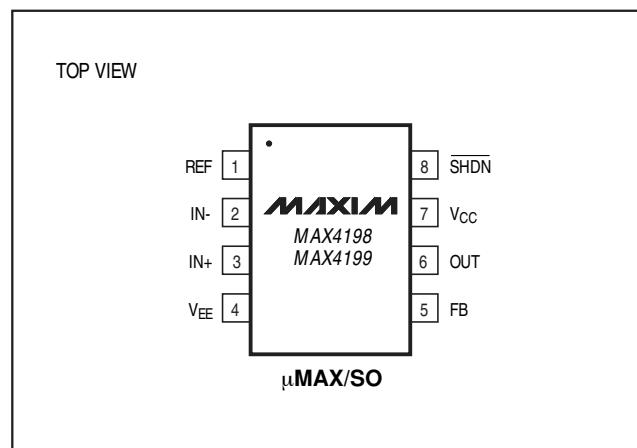

## Features

- ♦ Low 0.01% Gain Error
- ♦ High Common-Mode Rejection: 110dB (MAX4199)
- ♦ 10 $\mu V$  Input Offset Voltage (MAX4199)  
30 $\mu V$  Input Offset Voltage (MAX4198)
- ♦ +2.7V to +7.5V Single-Supply Operation
- ♦ 42 $\mu A$  Supply Current
- ♦ 175kHz (MAX4198) and 45kHz (MAX4199)  
-3dB Bandwidth
- ♦ 6.5 $\mu A$  Shutdown Current
- ♦ Rail-to-Rail Outputs Drive 5k $\Omega$  Loads
- ♦ Input Voltage Range Extends 100mV Beyond-the-Rails (MAX4198)
- ♦ Available in Space-Saving 8-Pin  $\mu$ MAX Package

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	GAIN (V/V)
MAX4198EUA	-40°C to +85°C	8 $\mu$ MAX	1
MAX4198ESA	-40°C to +85°C	8 SO	1
MAX4199EUA	-40°C to +85°C	8 $\mu$ MAX	10
MAX4199ESA	-40°C to +85°C	8 SO	10

## Pin Configuration

# Micropower, Single-Supply, Rail-to-Rail Precision Differential Amplifiers

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage ( $V_{CC}$ to $V_{EE}$ )	+8V
All Other Pins to GND	( $V_{EE} - 0.3V$ ) to ( $V_{CC} + 0.3V$ )
Output Short-Circuit Duration (to $V_{CC}$ or $V_{EE}$ )	Continuous
Continuous Power Dissipation ( $T_A = +70^\circ C$ )	
8-Pin SO (derate 9.09mW/ $^\circ C$ above $+70^\circ C$ )	471mW
8-Pin $\mu$ MAX (derate 4.1mW/ $^\circ C$ above $+70^\circ C$ )	330mW

Operating Temperature Range	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS—MAX4198 (+5V Supply)

( $V_{CC} = +5V$ ,  $V_{EE} = 0V$ ,  $R_L = 25k\Omega$  tied to  $V_{CC}/2$ ,  $V_{REF} = V_{CC}/2$ ,  $V_{SHDN} = V_{CC} - 1.5V$ , typical values are at  $T_A = +25^\circ C$ ,  $T_A = T_{MIN}$  to  $T_{MAX}$ , unless otherwise noted.) (Note 1)

## Pin Description

PIN	NAME	FUNCTION
1	REF	Reference Voltage Input. Offsets output voltage.
2	IN-	Inverting Input
3	IN+	Noninverting Input
4	$V_{EE}$	Negative Supply Voltage
5	FB	Feedback Resistor. Can be used as a sense input.
6	OUT	Amplifier Output
7	$V_{CC}$	Positive Supply Voltage
8	SHDN	Shutdown Control. Shutdown threshold is referenced to $V_{CC}$ . When pulled 2.5V below $V_{CC}$ , part is in shutdown.

## Detailed Description

The MAX4198/MAX4199 are precision low-power differential amplifiers with factory-trimmed internal gain-setting resistors. The MAX4198 is trimmed to a gain of  $+1V/V$  and the MAX4199 is trimmed to a gain of  $+10V/V$ .

### Input Stage

The *Functional Diagram* shows the internal structure of the MAX4198/MAX4199. Although the resistors are precision matched, their absolute value varies by  $\pm 25\%$ . The typical input impedance for the MAX4198 is  $50k\Omega$  for the noninverting input and  $25k\Omega$  for the inverting input. The typical input impedance for the MAX4199 is  $275k\Omega$  for the noninverting input and  $25k\Omega$  for the inverting input.

The common-mode inputs of the internal op amp can range from  $V_{EE}$  to  $(V_{CC} - 1.1V)$ . Although the inputs to the internal op amp are not rail-to-rail, the internal resistors form a voltage divider that extends the input common-mode range beyond-the-rails for the MAX4198. The overall input range of the MAX4198 extends  $100mV$  beyond-the-rails without adversely affecting common-mode rejection or undergoing phase reversal ( $V_{CC} = 5V$ ). The MAX4199 input common-mode range extends from  $100mV$  below the negative rail to  $(V_{CC} - 1V)$  (see the Input Common-Mode Voltage Range vs. Supply Voltage graph in the *Typical Operating Characteristics*).

## Rail-to-Rail Output Stage

The MAX4198/MAX4199 output stage incorporates a common-source rail-to-rail structure which maximizes the dynamic range of the differential amplifier. The output can swing to within 100mV from each rail with a  $5\text{k}\Omega$  load to  $\text{VCC}/2$  (see the *Typical Operating Characteristics*).

## Shutdown Mode

The MAX4198/MAX4199 have an active-low shutdown input.  $\overline{\text{SHDN}}$  input logic thresholds are referenced to  $\text{VCC}$ , not to GND. Pulling  $\overline{\text{SHDN}}$  2.5V below the positive rail places the amplifiers in a  $12\mu\text{A}$  (max) shutdown mode. The MAX4198/MAX4199 exit or enter shutdown in  $35\mu\text{s}$ . In shutdown, the OUT pin is high-impedance.

## Applications Information

### Driving Capacitive Loads

The MAX4198/MAX4199 are relatively immune to oscillations caused when driving large capacitive loads. Although heavy load capacitance increases transient ringing, sustained oscillations typically do not occur for loads under  $600\text{pF}$  (see Pulse Response with Capacitive Load in the *Typical Operating Characteristics*). Applications that require driving higher capacitive loads can isolate the output capacitance using a  $15\Omega$  to  $100\Omega$  resistor between the amplifier output and the load (Figure 1). Although adding an isolation resistor dampens the response enough to prevent oscillations, it does so at the expense of bandwidth and DC accuracy.

### Power Supply Considerations

The MAX4198/MAX4199 operate from single  $+2.7\text{V}$  to  $+7.5\text{V}$  supplies or from dual  $\pm 1.35\text{V}$  to  $\pm 3.75\text{V}$  supplies, and they consume only  $45\mu\text{A}$  of supply current. Excellent power-supply rejection permits the amplifiers to be operated directly from a decaying  $3\text{V}$  cell without excessive error. To maximize AC performance, the supply must be bypassed with a  $0.1\mu\text{F}$  ceramic capacitor to ground that must be as close as possible to the pin. If dual supplies are used, bypass both supply pins with  $0.1\mu\text{F}$  to ground.

### Application Circuits

Differential amplifiers can be used in single-ended and other amplifier applications. Figures 2 through 6 show the MAX4198/MAX4199 in different configurations. The internally trimmed and matched resistors offer convenience and have a distinct advantage over external resistors. These amplifiers are not compensated for single-ended unity gain; therefore, IN- should not be connected to OUT or left unconnected.

## Instrumentation Amplifier Applications

For applications that require a complete low-power instrumentation amplifier, refer to the MAX4194–MAX4197 data sheet. Some differential to single-ended voltage amplifier applications that do not require a high input impedance can use the MAX4198/MAX4199 for gains of +1V/V or +10V/V. The MAX4198/MAX4199 can

also be used as an instrumentation amplifier building block. The circuit of Figure 7 takes advantage of the 10pA (max), 0.1pA (typ) bias current of the MAX406A to form an instrumentation amplifier similar to the MAX4194 family, except with lower input bias currents. The MAX406A's low 1.2 $\mu$ A supply current maintains a low overall supply current.

## Chip Information

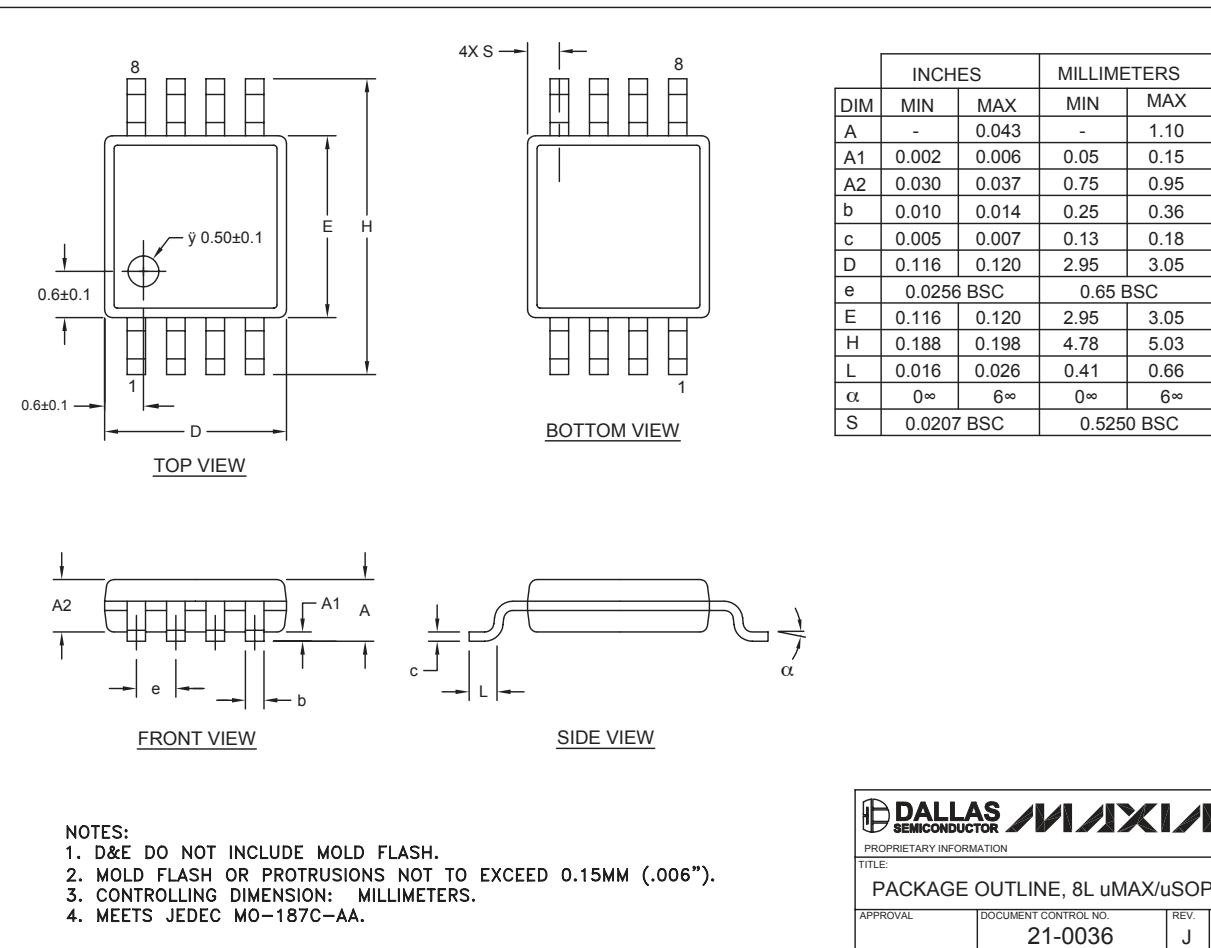

TRANSISTOR COUNT: 250

SUBSTRATE CONNECTED TO VEE

## Package Information

(The package drawing(s) in this data sheet may not reflect the most current specifications. For the latest package outline information, go to [www.maxim-ic.com/packages](http://www.maxim-ic.com/packages).)

BLUMAXD.IPS

- NOTES:
1. D&E DO NOT INCLUDE MOLD FLASH.
  2. MOLD FLASH OR PROTRUSIONS NOT TO EXCEED 0.15MM (.006").
  3. CONTROLLING DIMENSION: MILLIMETERS.
  4. MEETS JEDEC MO-187C-AA.

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
