NOTES:

- DC current (I_{dc}) that will cause an approximate ΔT of 40°C
- DC current (I_{sat}) that will cause Lo to drop approximately 20%
- All test data is referenced to 25°C ambient
- Operating Temperature Range -55°C to +150°C
- The part temperature (ambient + temp rise) should not exceed 150°C under the worst operating conditions. Circuit design, component placement, PWB trace size and thickness, airflow and other cooling provisions all affect the part temperature. Part temperature should be verified in the end application.

Safety precaution

(A) This product employs a core with low insulation resistance. Pay strict attention when use it.

1. Do not make any through holes and copper pattern in the oblique line area. Except a copper pattern to the electrode.
2. Don't design/mount any components in contact with this product.

(B) Provision to abnormal condition

This power choke coil itself does not have any protective function in abnormal condition such as overload, short circuit, open conditions and etc. Therefore, it shall be confirmed as the end product that there is no risk of smoking, fire, dielectric withstand voltage, insulation resistance and etc in abnormal conditions to provide protective devices and/or protection circuit in the end product.

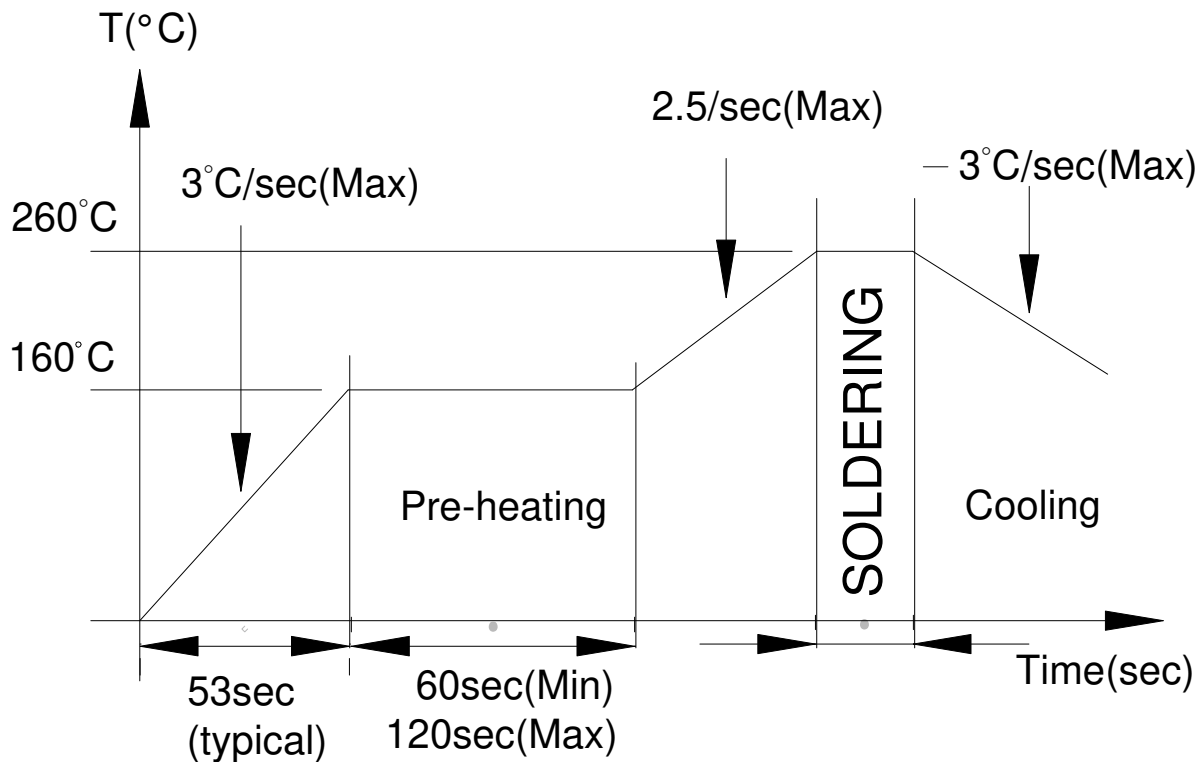

RELIABILITY TEST

*Electrical performance test		
Item	Specification	Test method
Inductance	Refer to the electrical specifications.	Measured with a LCR meter Agilent4284A,CH3302G
DC Resistance		Micro-ohm meter CH11025
Saturation current		DC current (A) that will cause L0 to drop approximately 30% (environment temperature of 25°C)
Heat rating current		DC current (A) that will cause an approximate ΔT of 40°C (environment temperature of 25°C)
*Mechanical performance test		
bending	Change from an initial value Inductance: within $\pm 10\%$	Apply pressure gradually in the direction of the arrow at a rate of about 0.5mm/s until bent depth reaches 2mm and hold for 30 sec. Boad : 40*100mm , thickness: 1mm
Adhesion strength	Change from an initial value Inductance: within $\pm 10\%$	A static load using a R0.5 pressing tool shall be applied to the body of the specimen in the direction of the arrow and shall be hold for 60 \pm 5 sec. Mesure after removing pressure.
Vibration	Change from an initial value Inductance: within $\pm 10\%$	The specimen shall be subjected to a vibration of 1.5mm amplitude, sweep frequency 10~55Hz(10Hz to 55Hz to 10Hz in aperiod of one minute) for 2hr in each of 3(X,Y,Z) axes.
Mechanical shock	Change from an initial value Inductance: within $\pm 10\%$	Dropped onto printed circuit board from 100cm height three times in x, y, z directions. The terminals shall be protected.
