

## Features

- **HIGH-DENSITY PROGRAMMABLE LOGIC**
  - 2000 PLD Gates
  - 32 I/O Pins, One Dedicated Input
  - 96 Registers
  - High-Speed Global Interconnect
  - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
  - Small Logic Block Size for Random Logic
  - Functionally Compatible with ispLSI 1016E
- **NEW FEATURES**
  - 100% IEEE 1149.1 Boundary Scan Testable
  - ispJTAG<sup>™</sup> In-System Programmable via IEEE 1149.1 (JTAG) Test Access Port
  - User-Selectable 3.3V or 5V I/O Supports Mixed-Voltage Systems (V<sub>CCIO</sub> Pin)
  - Open-Drain Output Option
- **HIGH-PERFORMANCE E<sup>2</sup>CMOS<sup>®</sup> TECHNOLOGY**
  - f<sub>max</sub> = 200 MHz Maximum Operating Frequency
  - t<sub>pd</sub> = 4.5 ns Propagation Delay
  - TTL Compatible Inputs and Outputs
  - Electrically Erasable and Reprogrammable
  - Non-Volatile
  - 100% Tested at Time of Manufacture
  - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
  - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
  - Reprogram Soldered Device for Faster Prototyping
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
  - Complete Programmable Device Can Combine Glue Logic and Structured Designs
  - Enhanced Pin Locking Capability
  - Three Dedicated Clock Input Pins
  - Synchronous and Asynchronous Clocks
  - Programmable Output Slew Rate Control to Minimize Switching Noise
  - Flexible Pin Placement
  - Optimized Global Routing Pool Provides Global Interconnectivity

## Functional Block Diagram

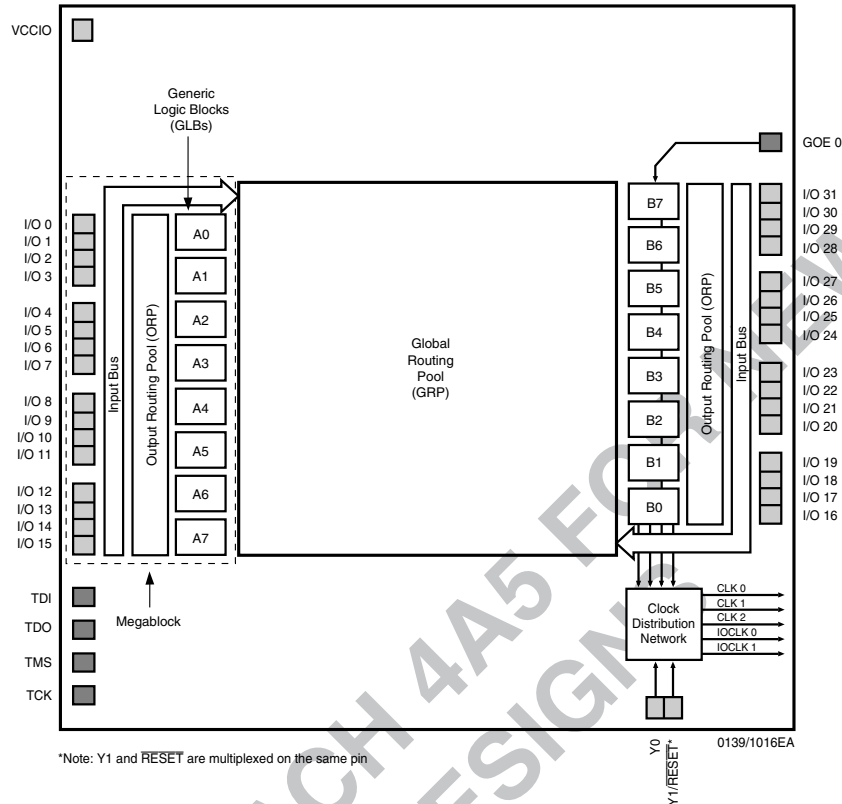

## Description

The ispLSI 1016EA is a High Density Programmable Logic Device containing 96 Registers, 32 Universal I/O pins, one Dedicated Input pin, two Dedicated Clock Input pins, one Global OE input pin and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 1016EA features 5V in-system programmability (ISP<sup>™</sup>) and in-system diagnostic capabilities via an IEEE 1149.1 Test Access Port. The ispLSI 1016EA offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems. A functional superset of the ispLSI 1016 architecture, the ispLSI 1016EA device adds user-selectable 3.3V or 5V I/O and open-drain output options.

The basic unit of logic on the ispLSI 1016EA device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1...B7 (Figure 1). There are a total of 16 GLBs in the ispLSI 1016EA device. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and a dedicated input. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any other GLB on the device.

**Functional Block Diagram**

**Figure 1. ispLSI 1016EA Functional Block Diagram**

The device also has 32 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, registered input, latched input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 2 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise. By connecting the VCCIO pin to a common 5V or 3.3V power supply, I/O output levels can be matched to 5V or 3.3V-compatible voltages.

Eight GLBs, 16 I/O cells, a dedicated input (if available) and one ORP are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 16 universal I/O cells by the ORP. Each ispLSI 1016EA device contains two Megablocks.

The GRP has, as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

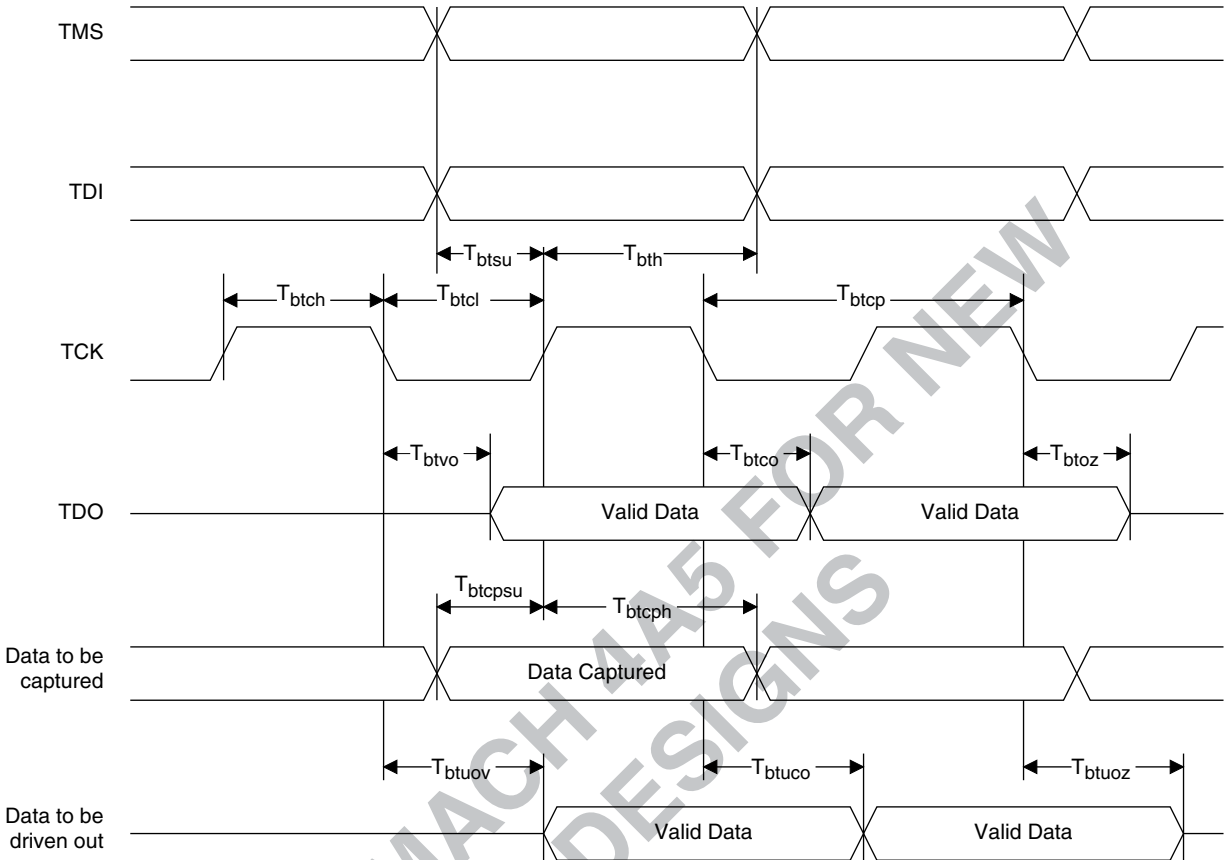

Clocks in the ispLSI 1016EA device are selected using the Clock Distribution Network. Two dedicated clock pins (Y0 and Y1) are brought into the distribution network, and five clock outputs (CLK 0, CLK 1, CLK 2, IOCLK 0 and IOCLK 1) are provided to route clocks to the GLBs and I/O cells. The Clock Distribution Network can also be driven from a special clock GLB (B0 on the ispLSI 1016EA device). The logic of this GLB allows the user to create an internal clock from a combination of internal signals within the device.

**Programmable Open-Drain Outputs**

In addition to the standard output configuration, the outputs of the ispLSI 1016EA are individually programmable, either as a standard totem-pole output or an open-drain output. The totem-pole output drives the specified  $V_{oh}$  and  $V_{ol}$  levels, whereas the open-drain output drives only the specified  $V_{ol}$ . The  $V_{oh}$  level on the open-drain output depends on the external loading and pull-up. This output configuration is controlled by a programmable fuse. The default configuration when the device is in bulk erased state is totem-pole configuration. The open-drain/totem-pole option is selectable through the Lattice software tools.

**Boundary Scan**

**Figure 2. Boundary Scan Waveforms and Timing Specifications**

Symbol	Parameter	Min	Max	Units
$t_{btcp}$	TCK [BSCAN test] clock pulse width	100	–	ns
$t_{btch}$	TCK [BSCAN test] pulse width high	50	–	ns
$t_{btcl}$	TCK [BSCAN test] pulse width low	50	–	ns
$t_{btso}$	TCK [BSCAN test] setup time	20	–	ns
$t_{bth}$	TCK [BSCAN test] hold time	25	–	ns
$t_{rf}$	TCK [BSCAN test] rise and fall time	50	–	mV/ns
$t_{btco}$	TAP controller falling edge of clock to valid output	–	25	ns
$t_{btouz}$	TAP controller falling edge of clock to data output disable	–	25	ns
$t_{btvo}$	TAP controller falling edge of clock to data output enable	–	25	ns
$t_{btcpso}$	BSCAN test Capture register setup time	40	–	ns
$t_{btcpso}$	BSCAN test Capture register hold time	25	–	ns
$t_{btuco}$	BSCAN test Update reg, falling edge of clock to valid output	–	50	ns
$t_{btuoz}$	BSCAN test Update reg, falling edge of clock to output disable	–	50	ns
$t_{btuov}$	BSCAN test Update reg, falling edge of clock to output enable	–	50	ns

## Absolute Maximum Ratings <sup>1</sup>

Supply Voltage  $V_{CC}$  ..... -0.5 to +7.0V  
 Input Voltage Applied ..... -2.5 to  $V_{CC} + 1.0V$   
 Off-State Output Voltage Applied ..... -2.5 to  $V_{CC} + 1.0V$   
 Storage Temperature ..... -65 to 150°C  
 Case Temp. with Power Applied ..... -55 to 125°C  
 Max. Junction Temp. ( $T_J$ ) with Power Applied ... 150°C

1. Stresses above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

## DC Recommended Operating Conditions

SYMBOL	PARAMETER		MIN.	MAX.	UNITS
$V_{CC}$	Supply Voltage	Commercial $T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$	4.75	5.25	V
$V_{CCIO}$	Supply Voltage: Output Drivers	5V	4.75	5.25	V
		3.3V	3.0	3.6	V
$V_{IL}$	Input Low Voltage		0	0.8	V
$V_{IH}$	Input High Voltage		2.0	$V_{CC} + 1$	V

Table 2-0005/1016EA

## Capacitance ( $T_A = 25^\circ\text{C}$ , $f = 1.0\text{ MHz}$ )

SYMBOL	PARAMETER	TYPICAL	UNITS	TEST CONDITIONS
$C_1$	Dedicated Input, I/O, Y1, Y2, Y3, Clock Capacitance (Commercial)	8	pf	$V_{CC} = 5.0V$ , $V_{PIN} = 2.0V$
$C_2$	Y0 Clock Capacitance	10	pf	$V_{CC} = 5.0V$ , $V_{PIN} = 2.0V$

Table 2-0006/1016EA

## Erase/Reprogram Specifications

PARAMETER	MINIMUM	MAXIMUM	UNITS
Erase/Reprogram Cycles	10000	—	Cycles

Table 2-0008/1016EA

**Switching Test Conditions**

Input Pulse Levels	GND to 3.0V
Input Rise and Fall Time 10% to 90%	1.5ns
Input Timing Reference Levels	1.5V
Output Timing Reference Levels	1.5V
Output Load	See Figure 3

3-state levels are measured 0.5V from steady-state active level.

Table 2-0003/1016EA

**Figure 3. Test Load**

\*CL includes Test Fixture and Probe Capacitance.

0213a

**Output Load Conditions (see Figure 3)**

TEST CONDITION		R1	R2	CL
A		470Ω	390Ω	35pF
B	Active High	∞	390Ω	35pF
	Active Low	470Ω	390Ω	35pF
C	Active High to Z at $V_{OH}-0.5V$	∞	390Ω	5pF
	Active Low to Z at $V_{OL}+0.5V$	470Ω	390Ω	5pF

Table 2-0004/1016E

**DC Electrical Characteristics**

**Over Recommended Operating Conditions**

SYMBOL	PARAMETER	CONDITION	MIN.	TYP. <sup>3</sup>	MAX.	UNITS
<b>V<sub>OL</sub></b>	Output Low Voltage	$I_{OL} = 8 \text{ mA}$	—	—	0.4	V
<b>V<sub>OH</sub></b>	Output High Voltage	$I_{OH} = -2 \text{ mA}, V_{CCIO} = 3.0V$	2.4	—	—	V
		$I_{OH} = -4 \text{ mA}, V_{CCIO} = 4.75V$	2.4	—	—	V
<b>I<sub>IL</sub></b>	Input or I/O Low Leakage Current	$0V \leq V_{IN} \leq V_{IL} \text{ (Max.)}$	—	—	-10	μA
<b>I<sub>IH</sub></b>	Input or I/O High Leakage Current	$(V_{CCIO} - 0.2)V \leq V_{IN} \leq V_{CCIO}$	—	—	10	μA
		$V_{CCIO} \leq V_{IN} \leq 5.25V$	—	—	10	μA
<b>I<sub>IL-PU</sub></b>	I/O Active Pull-Up Current	$0V \leq V_{IN} \leq V_{IL}$	—	—	-200	μA
<b>I<sub>OS</sub><sup>1</sup></b>	Output Short Circuit Current	$V_{CCIO} = 5.0V \text{ or } 3.3V, V_{OUT} = 0.5V$	—	—	-240	mA
<b>I<sub>CC</sub><sup>2,4,5</sup></b>	Operating Power Supply Current	$V_{IL} = 0.0V, V_{IH} = 3.0V$ $f_{TOGGLE} = 1 \text{ MHz}$	—	91	—	mA

Table 2-0007/1016EA

- One output at a time for a maximum duration of one second.  $V_{OUT} = 0.5V$  was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
- Measured using four 16-bit counters.
- Typical values are at  $V_{CC} = 5V$  and  $T_A = 25^\circ C$ .
- Unused inputs held at 0.0V.
- Maximum  $I_{CC}$  varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and the Thermal Management section of the Lattice Semiconductor Data Book CD-ROM to estimate maximum  $I_{CC}$ .

1. Calculations are based upon timing specifications for the ispLSI 1016EA-200.

**Maximum GRP Delay vs GLB Loads**

**Power Consumption**

Power consumption in the ispLSI 1016EA device depends on two primary factors: the speed at which the device is operating and the number of Product Terms

used. Figure 4 shows the relationship between power and operating speed.

**Figure 4. Typical Device Power Consumption vs fmax**

Notes: Configuration of four 16-bit counters  
Typical current at 5V, 25°C

ICC can be estimated for the ispLSI 1016EA using the following equation:

$$I_{CC}(mA) = 23 + (\# \text{ of PTs} * 0.52) + (\# \text{ of nets} * \text{max freq} * 0.004)$$

Where:

- # of PTs = Number of product terms used in design
- # of nets = Number of signals used in device
- Max freq = Highest clock frequency to the device (in MHz)

The ICC estimate is based on typical conditions (VCC = 5.0V, room temperature) and an assumption of four GLB loads on average exists and the device is filled with four 16-bit counters. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.

## Pin Description

NAME	PLCC PIN NUMBERS	TQFP PIN NUMBERS	DESCRIPTION
I/O 0 - I/O 3 I/O 4 - I/O 7 I/O 8 - I/O 11 I/O 12 - I/O 15 I/O 16 - I/O 19 I/O 20 - I/O 23 I/O 24 - I/O 27 I/O 28 - I/O 31	15, 16, 17, 18, 19, 20, 21, 22, 25, 26, 27, 28, 29, 30, 31, 32, 37, 38, 39, 40, 41, 42, 43, 44, 3, 4, 5, 6, 7, 8, 9, 10	9, 10, 11, 12, 13, 14, 15, 16, 19, 20, 21, 22, 23, 24, 25, 26, 31, 32, 33, 34, 35, 36, 37, 38, 41, 42, 43, 44, 1, 2, 3, 4	Input/Output Pins - These are the general purpose I/O pins used by the logic array.
GOE 0/IN 3 <sup>1</sup>	2	40	This is a dual function pin. It can be used either as Global Output Enable for all I/O cells or it can be used as a dedicated input pin.
TDI	14	8	Input - Functions as an input pin to load programming data into the device and also used as one of the two control pins for the ispJTAG state machine.
TMS	36	30	Input - Controls the operation of the ISP state machine.
TDO	24	18	Output - Functions as an output pin to read serial shift register data.
TCK	33	27	Input - Functions as a clock pin for the Serial Shift Register.
Y0	11	5	Dedicated Clock input. This clock input is connected to one of the clock inputs of all of the GLBs on the device.
Y1/RESET <sup>1</sup>	35	29	This pin performs two functions: Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB on the device. Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device.
GND	1, 23	17, 39	Ground (GND)
VCC	12, 34	6, 28	VCC
VCCIO	13	7	Supply voltage for output drivers, 5V or 3.3V.

1. Pins have dual function capability which is software selectable.
