

EV3416-QH-00B

1.1A Switching Current, Low- I_Q , Step-Up Converter with Output Disconnect Evaluation Board

DESCRIPTION

The EV3416-QH-00A is an evaluation board designed to demonstrate the capabilities of the MP3416, a 1.1A switching current, low quiescent current (I_Q), step-up converter with output disconnect.

Peak current control provides fast transient response. The integrated, synchronous P-channel rectifier improves efficiency and eliminates the need for an external Schottky diode.

The MP3416 employs pulse-skip mode (PSM) to reduce power loss during light-load operation. During shutdown, the output disconnects from input to allow for a shutdown current (I_{SD}) below $0.65\mu A$.

The MP3416 is available in a small QFN-8 (1.5mmx2mm) package.

QUICK START GUIDE

The evaluation board's output voltage (V_{OUT}) is set at 3.3V. The board layout accommodates most commonly used components.

1. Preset the power supply between 1.25V and 5.5V.
2. Turn off the power supply.
3. Connect the power supply terminals to:
 - a. Positive (+): VIN
 - b. Negative (-): GND
4. Connect the load terminals to:
 - a. Positive (+): VOUT
 - b. Negative (-): GND
5. After making the connections, turn on the power supply. The board should start up automatically.
6. A resistor (R2) sets V_{OUT} . The adjusted V_{OUT} can be calculated with Equation (1):

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R1}{R2}\right) \quad (1)$$

Where V_{FB} is the feedback voltage (0.504V), and R1 is 1M Ω .

7. To use the enable (EN) function, apply a digital input to the EN pin. Pull EN above 0.7V to turn the converter on; pull EN below 0.2V to turn it off.
