

NLSX4378A

4-Bit 24 Mb/s Dual-Supply Level Translator

The NLSX4378A is a 4-bit configurable dual-supply bidirectional auto sensing translator that does not require a directional control pin. The V_{CC} I/O and V_L I/O ports are designed to track two different power supply rails, V_{CC} and V_L respectively. The V_{CC} and V_L supply rails are configurable from 1.65 V to 5.5 V. This allows voltage logic signals on the V_L side to be translated into lower, higher or equal value voltage logic signals on the V_{CC} side, and vice-versa.

The NLSX4378A translator has open-drain outputs with integrated 10 k Ω pullup resistors on the I/O lines. The integrated pullup resistors are used to pullup the I/O lines to either V_L or V_{CC} . The NLSX4378A is an excellent match for open-drain applications such as the I²C communication bus.

Features

- V_L can be Less than, Greater than or Equal to V_{CC}
- Wide V_{CC} Operating Range: 1.65 V to 5.5 V
Wide V_L Operating Range: 1.65 V to 5.5 V
- High-Speed with 24 Mb/s Guaranteed Data Rate
- Low Bit-to-Bit Skew
- Enable Input is Overvoltage Tolerant (OVT) to 5.5 V
- Nonpreferential Powerup Sequencing
- Integrated 10 k Ω Pullup Resistors
- ESD Protection: >7 kV HBM for all pins
- Small Space Saving Package – 2.02 x 1.54 mm μ Bump12
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- I²C, SMBus, PMBus
- Low Voltage ASIC Level Translation
- Mobile Phones, PDAs, Cameras

MAXIMUM RATINGS

Symbol	Parameter	Condition	Value	Unit
V_{CC}	DC Supply Voltage		-0.3 to +7.0	V
V_L	DC Supply Voltage		-0.3 to +7.0	V
I/O V_{CC}	V_{CC} -Referenced DC Input/Output Voltage		-0.3 to ($V_{CC} + 0.3$)	V
I/O V_L	V_L -Referenced DC Input/Output Voltage		-0.3 to ($V_L + 0.3$)	V
V_{EN}	Enable Control Pin DC Input Voltage		-0.3 to +7.0	V
I_{I/O_SC}	Short-Circuit Duration (I/O V_L and I/O V_{CC} to GND)	Continuous	40	mA
T_{STG}	Storage Temperature		-65 to +150	°C
I_{LU}	Latch-up Current		100	mA
ESD Rating	Human Body Model Charged Device Model		7000 2000	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
V_{CC}	DC Supply Voltage	1.65	5.5	V
V_L	DC Supply Voltage	1.65	5.5	V
V_{EN}	Enable Control Pin Voltage	GND	5.5	V
V_{IO}	I/O Pin Voltage	GND	V_{CC} or V_L	V
T_A	Operating Temperature Range	-55	+125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

NLSX4378A

DC ELECTRICAL CHARACTERISTICS ($V_{CC} = 1.65\text{ V to }5.5\text{ V}$ and $V_L = 1.65\text{ V to }5.5\text{ V}$, unless otherwise specified)

APPLICATIONS INFORMATION

Level Translator Architecture

The NLSX4378A auto sense translator provides bi-directional voltage level shifting to transfer data in multiple supply voltage systems. This device has two supply voltages, V_L and V_{CC} , which set the logic levels on the input and output sides of the translator. When used to transfer data from the V_L to the V_{CC} ports, input signals referenced to the V_L supply are translated to output signals with a logic level matched to V_{CC} . In a similar manner, the V_{CC} to V_L translation shifts input signals with a logic level compatible to V_{CC} to an output signal matched to V_L .

The NLSX4378A consists of four bi-directional channels that independently determine the direction of the data flow without requiring a directional pin. The one-shot circuits are used to detect the rising input signals. In addition, the one shots decrease the rise time of the output signal for low-to-high transitions.

Each input/output pin has an internal 10 k Ω pull-up resistor. The magnitude of the pull-up resistors can be reduced by connecting external resistors in parallel to the internal 10 k Ω resistors.

Input Driver Requirements

The rise (t_R) and fall (t_F) timing parameters of the open drain outputs depend on the magnitude of the pull-up resistors. In addition, the propagation times (t_{PD}), skew (t_{SKEW}) and maximum data rate depend on the impedance of the device that is connected to the translator. The timing

parameters listed in the data sheet assume that the output impedance of the drivers connected to the translator is less than 50 Ω .

Enable Input (EN)

The NLSX4378A has an Enable pin (EN) that provides tri-state operation at the I/O pins. Driving the Enable pin to a low logic level minimizes the power consumption of the device and drives the I/O V_{CC} and I/O V_L pins to a high impedance state. Normal translation operation occurs when the EN pin is equal to a logic high signal. The EN pin is referenced to the V_L supply and has Overvoltage Tolerant (OVT) protection.

Power Supply Guidelines

During normal operation, supply voltage V_L can be greater than, less than or equal to V_{CC} . The sequencing of the power supplies will not damage the device during the power up operation.

For optimal performance, 0.01 μ F to 0.1 μ F decoupling capacitors should be used on the V_L and V_{CC} power supply pins. Ceramic capacitors are a good design choice to filter and bypass any noise signals on the voltage lines to the ground plane of the PCB. The noise immunity will be maximized by placing the capacitors as close as possible to the supply and ground pins, along with minimizing the PCB connection traces.
