## DESCRIPTION

The FCT240T, FCT241T and FCT244T are 8-bit buffers/line drivers with three-state outputs that are ideal for driving high-capacitance loads as in memory address and data buses. The FCT2240T, FCT2241T and FCT2244T are 25Ω resistor output versions useful for driving transmission lines and reducing system noise. The 2240, 2241, 2244 series parts can replace the 240 series to reduce noise in an existing design. All inputs have clamp diodes for undershoot noise suppression. All outputs have ground bounce suppression (see QSI Application Note AN-001), and outputs will not load an active bus when V<sub>CC</sub> is removed from the device.

**Notes:**

1. Typical values indicate  $V_{CC}=5.0\text{V}$  and  $T_A=25^{\circ}\text{C}$ .
2. Not more than one output should be shorted and the duration is  $\leq 1$  second.
3. These parameters are guaranteed by design but not tested.

**POWER SUPPLY CHARACTERISTICS**

Symbol	Parameter	Test Conditions (1)	Min	Max	Unit
I <sub>cc</sub>	Quiescent Power Supply Current	V <sub>cc</sub> = MAX, freq = 0 0V ≤ V <sub>in</sub> ≤ 0.2V or V <sub>cc</sub> - 0.2V ≤ V <sub>in</sub> ≤ V <sub>cc</sub>	-	1.5	mA
ΔI <sub>cc</sub>	Supply Current per Input @ TTL HIGH	V <sub>cc</sub> = MAX, V <sub>in</sub> = 3.4 V, freq = 0 (2)	-	2.0	
Q <sub>ccd</sub>	Supply Current per input per mHz	V <sub>cc</sub> = MAX, Outputs open and enabled One bit toggling @ 50% duty cycle Other inputs at GND or V <sub>cc</sub> (3,4)	-	0.25	mA/ MHz

1. For conditions shown as MIN or MAX use the appropriate values specified under DC specifications.
2. Per TTL driven input (V<sub>i</sub>=3.4V)
3. For flipflops Q<sub>ccd</sub> is measured by switching one of the data input pins so that the output changes every clock cycle. This is a measurement of device power consumption only and does not include power to drive load capacitance or tester capacitance. This parameter is guaranteed by design but not tested.
4. I<sub>c</sub> can be computed using the above parameters as explained in the Technical Overview section.
