

The CPCO Series (77mm) Current Probes are Clamp On current sensors capable of measuring ac and dc currents available in ranges of ±500A, ±1000A, ±2000, ±4000A, ±8000A or ±12000A with an accuracy of +/-1% and non-linearity of <+/-0.5%. The bandwidth is dc to 40kHz. The Probe splits along a diameter allowing easy installation to existing cables without having to break the connection. A captive screw is used rather than a clip to ensure consistent closure under mechanical loading or vibration.

The Current Probes utilize Hall effect sensing technology with no magnetic core. This eliminates magnetic hysteresis and non-linearity effects present in conventional open loop sensors with magnetic cores.

FEATURES

- Clamp On
- Light Weight <120g
- Low Power <0.5W for Voltage Output Signal;
<0.8W for 4-20mA Output Signal
- Operating Voltage: Single rail power supply for all versions
- Current Ranges: ±500, ±1000, ±2000, ±4000A, ±8000A, ±12000A
- Accuracy: ±1%
- Non-Linearity: <±0.5%
- Wide Bandwidth: dc to 40kHz
- Output Signal Options: Single Ended 5V, Bi Polar 5V, Bi Polar 10V, 4-20mA and RMS
- Power ON LED indicator
- Low noise <0.1% of FS
- Reverse power supply voltage protected
- High rejection of external magnetic fields, e.g. from external conductors
- Output short circuit protection (except for 4-20mA version)

ORDERING INFORMATION

Part Number Format:

CPCO - Current Range - Aperture - Output Signal Type

CPCO

CPCO = Current Probe Clamp On

Current Range

500 = ± 500A
1000 = ± 1000A
2000 = ± 2000A
4000 = ± 4000A
8000 = ± 8000A
12000 = ± 12000A

Output Signal Type

SE = Single Ended, 5.0V±5.0V
BP5 = Bi Polar, 0.0V ± 5.0V
BP10 = Bi Polar, 0.0V ±10V
RMS = RMS, 0-3V
MA = 4-20mA Source, 12mA±8mA

Aperture

77mm

e.g. CPCO-4000-77-BP10

Current Probe Clamp On, 4000A, 77mm Diameter Aperture, Bi Polar ±10V Output Signal

CPCO Series (77mm)
DC-AC Current Probe, Clamp On
±500A, ±1000A, ±2000 or ±4000A, ±8000 or ±12000A

TABLE 1: ELECTRICAL SPECIFICATIONS

Specifications by Current Range								
Specification	Symbol	CPCO-500	CPCO-1000	CPCO-2000	CPCO-4000	CPCO-8000	CPCO-12000	
Primary Current, Nominal	I_{PN}	±500A	±1000A	±2000A	±4000A	±8000A	±12000A	
Primary Current, Max	I_{PSAT}	±625A	±1250A	±2500A	±5000A	±10000A	±15000A	
Primary Current, Overload	I_{POL}	No Limit						
Sensitivity Accuracy	SA	±1 % of FS						
Non Linearity	NL	< ±0.5% of I_{PN} (Primary Current, Nominal)						
Sensitivity	SE Output	S	8mV/A	4mV/A	2mV/A	1mV/A	0.5mV/A	0.3mV/A
	BP5 Output		8mV/A	4mV/A	2mV/A	1mV/A	0.5mV/A	0.3mV/A

Signal Output Option Descriptions

SE Option - The SE stands for Single Ended and the output voltage from the CPCO will have a quiescent output voltage of 5.0V when there is no primary current ($I_p=0A$). As the primary current (I_p) increases in a positive direction, the output voltage will increase to the maximum level of 10.0V at $I_p=+I_{PSAT}$. When the primary current increases in the negative direction, the output voltage will decrease toward 0.0V at $I_p=-I_{PSAT}$. See below output characteristics.

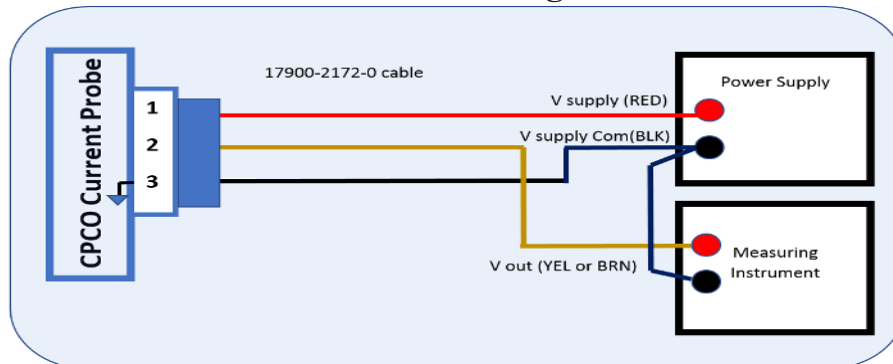

This option is useful for applications that drive circuitry that can only accommodate positive signal inputs voltages such as inputs to A/D's

Recommended Connection Diagram

Alternate Connection Diagram

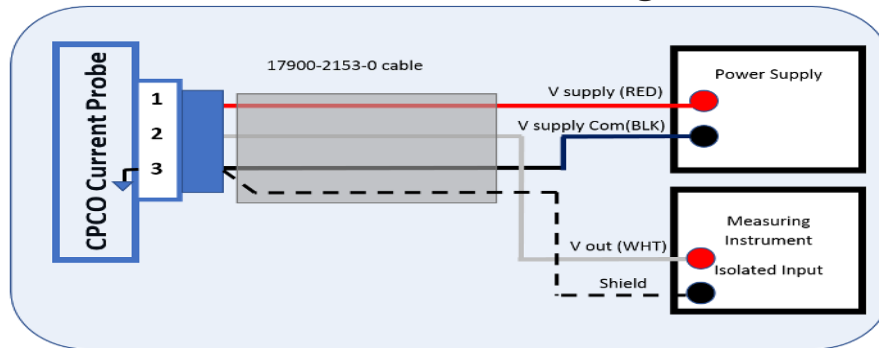

BP5 Option - The BP stands for Bi Polar and the output voltage from the CPCO will have a quiescent output voltage of 0.0V when there is no primary current ($I_p=0A$). As the primary current (I_p) increases in a positive direction, the output voltage will increase to the maximum level of 5.0V at $I_p=+I_{PSAT}$. When the primary current increases in the negative direction, the output voltage will decrease toward -5.0V at $I_p=-I_{PSAT}$. See below output characteristics.

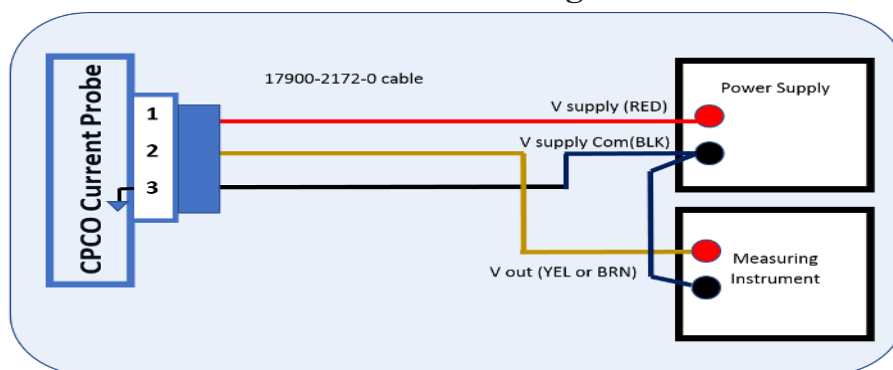

This option is useful for applications that drive circuitry that can accommodate Bi Polar signal inputs that swing around Com (0.0V) such as oscilloscopes, data loggers, multi-meters, etc.

Recommended Connection Diagram

Alternate Connection Diagram

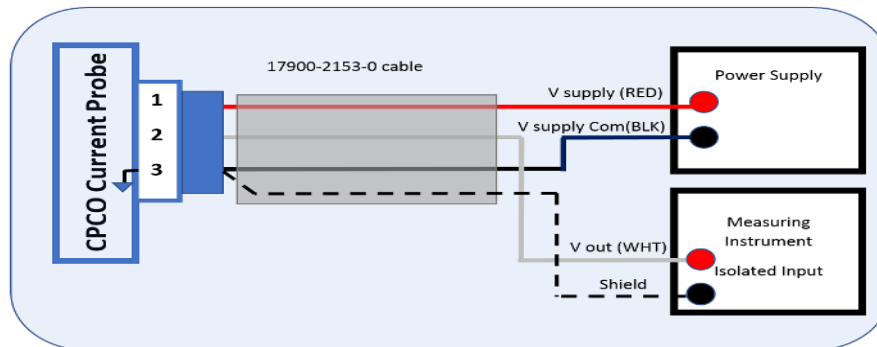

Revision Date: 23 July 2019

BP10 Option - The BP stands for Bi Polar and the output voltage from the CPCO will have a quiescent output voltage of 0.0V when there is no primary current ($I_p=0A$). As the primary current (I_p) increases in a positive direction, the output voltage will increase to the maximum level of 10.0V at $I_p=+I_{PSAT}$. When the primary current increases in the negative direction, the output voltage will decrease toward -10.0V at $I_p=-I_{PSAT}$. See below output characteristics.

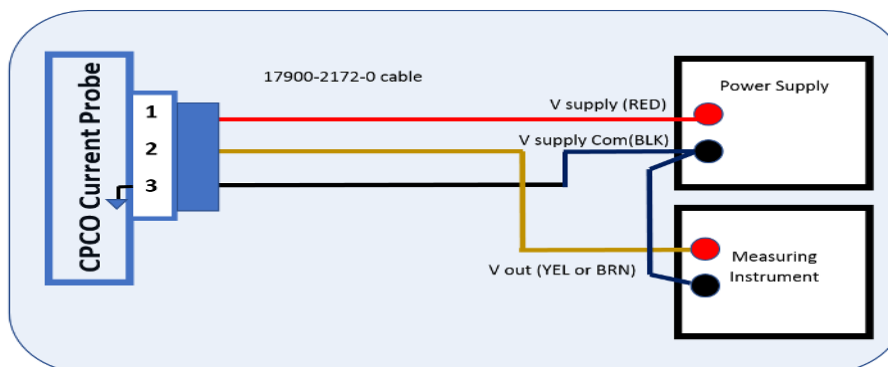

This option is useful for applications that drive circuitry that need higher voltages and can accommodate Bi Polar signal inputs that swing around Com (0.0V) such as oscilloscopes, data loggers, multi-meters, etc.

Recommended Connection Diagram

Alternate Connection Diagram

Revision Date: 23 July 2019

MA Option - The MA stands for **Milli-Amp** and the output from the CPCO will be a current source ranging from 4mA to 20mA. There is a quiescent output current source of 12mA when there is no primary current ($I_p=0A$). As the primary current (I_p) increases in a positive direction, the output current source will increase to the maximum level of 20.0mA at $I_p=+I_{PSAT}$. When the primary current increases in the negative direction, the output current source will decrease toward 4mA at $I_p=-I_{PSAT}$. The output current comes from the input power supply, therefore the CPCO power supply must be capable of providing the CPCO current of approx 50mA plus the output source current of up to 20mA. See below output characteristics.

This option is applicable to standard 4-20mA circuit configurations and optimum in noisy environments with long cable runs. The 4-20mA current source output is common with PLC's. Offset errors that can result from long cables are eliminated with the MA version.

Typical MA option circuit diagram.

The 4-20mA current source flows from the PLC power supply, for example, to the CPCO and then back to the PLC, 4-20mA input. The typical PLC input load resistor is 250ohm.

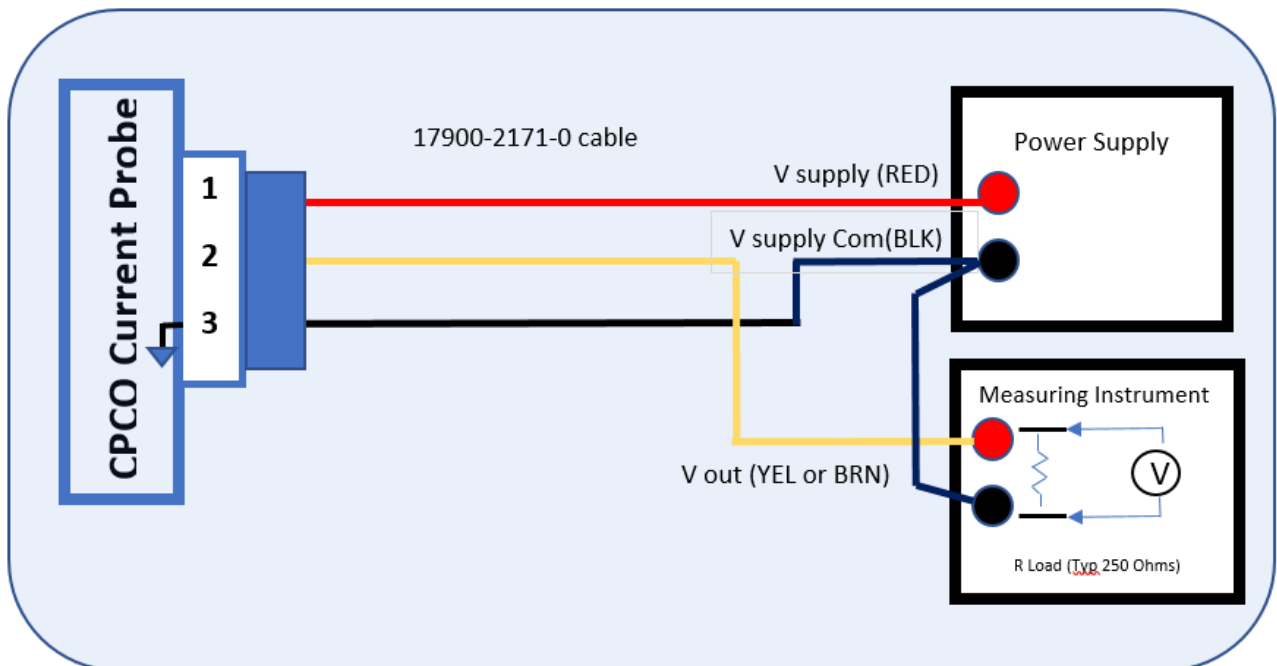

With a 250 ohm resistor, the voltage across the resistor will be :

$$V_{out} = I_{source} * R \text{ (example: at 12mA the } V_{out} = 3.00V \text{)}$$

Connection Diagram with 17900-2153-0 Cable

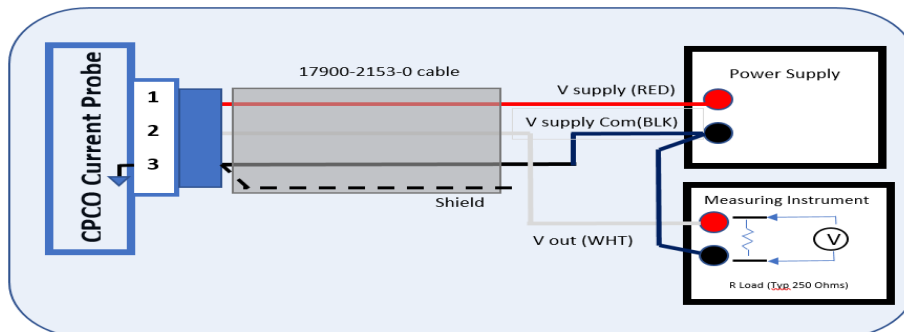

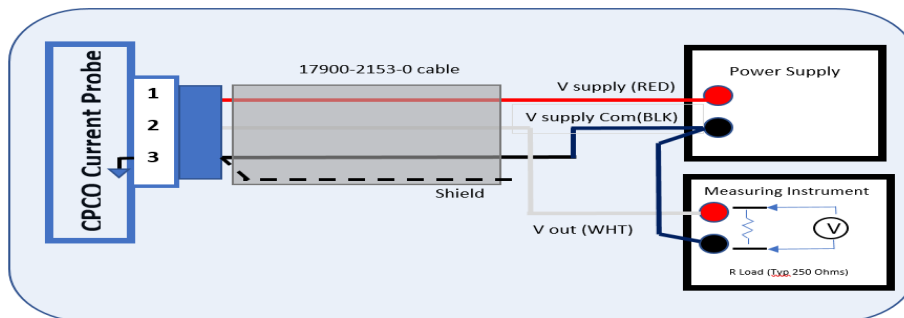

Connection Diagram with 17900-2171-0 Cable

Revision Date: 23 July 2019

RMS Option - RMS stands for **Root Mean Square** and the output voltage from the CPCO has a quiescent output voltage in the range of 0.0V to 0.020V when there is no primary current ($I_p=0A$). The output is an analog voltage that is proportional to the RMS value of the primary current over the complete dc to 50kHz (-3dB) bandwidth of the primary current. See the output characteristic below.

Accurate RMS measurements of a time varying primary current require that the peak current never exceeds $\pm I_{PN}$ to ensure that the CPCO is operating within the linear electronic range to avoid limiting of the CPCO signal. For a sine wave primary current, I_{PRMS} is $0.707 * I_{PN}$. This implies that the maximum RMS primary sine current should be $< 0.707 I_{PN}$ for the highest accuracy RMS output signal. For primary currents with occasional high current transients it is essential that the transients do not exceed I_{PSAT} . For this type of primary current waveform, the maximum allowed RMS current may be much less than $0.707 I_{PN}$.

Revision Date: 23 July 2019

Power Supply (Vs)

The CPCO incorporates a switching power supply to convert the input power to the internal low voltage operating voltages and reduce the internal power dissipation. The power consumption is relatively constant, therefore the input current is inversely proportional to supply voltage, Vs. The max current is specified to be 47mA once the input voltage reaches the normal operating range of 11-31V, however during the turn-on the current required is higher. See the below graph for the power current required. The power supply used to operate the CPCO, must have at least 150mA capability otherwise the CPCO will not turn on.
