#### CY74FCT163H245

- Bus hold on data inputs
- Eliminates the need for external pull-up or pull-down resistors
- Devices with bus hold are not recommended for translating rail-to-rail CMOS signals to 3.3V logic levels

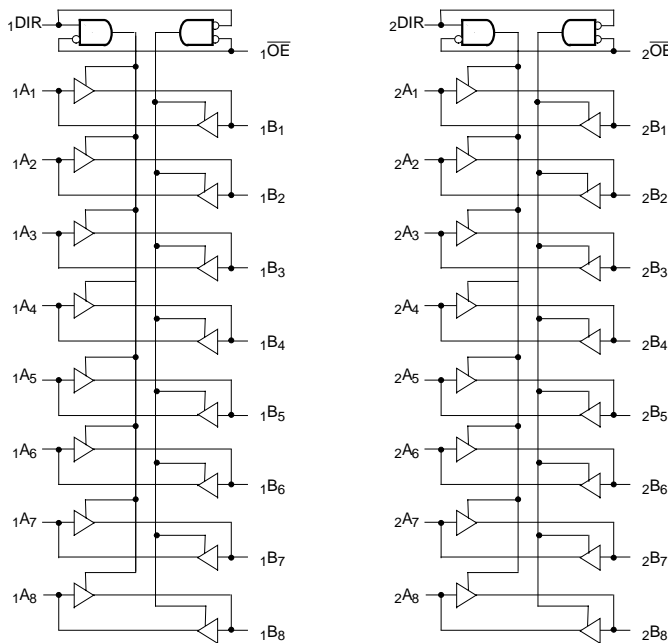

### Functional Description

These 16-bit transceivers are designed for use in bidirectional synchronous communication between two buses, where high speed and low power are required. Direction of data flow is controlled by (DIR), the Output Enable ( $\overline{OE}$ ) transfers data when LOW and isolates the buses when HIGH. The outputs are 24-mA balanced output drivers with current limiting resistors to reduce the need for external terminating resistors and provide for minimal undershoot and reduced ground bounce..

The CY74FCT163H245 has "bus hold" on the data inputs, which retains the input's last state whenever the input goes to high impedance. This eliminates the need for pull-up/down resistors and prevents floating inputs.

The CY74FCT163245 is designed with inputs and outputs capable of being driven by 5.0V buses, allowing its use in mixed voltage systems as a translator. The outputs are also designed with a power off disable feature enabling its use in applications requiring live insertion.

**Note:**

- On the CY74FCT163H245, these pins have bus hold.
- H = HIGH Voltage Level. L = LOW Voltage Level. X = Don't Care. Z = High Impedance.
- Operation beyond the limits set forth may impair the useful life of the device. Unless otherwise noted, these limits are over the operating free-air temperature range.
- Unused inputs must always be connected to an appropriate logic voltage level, preferably either V<sub>CC</sub> or ground.
- Typical values are at V<sub>CC</sub>=3.3V, T<sub>A</sub> = +25°C ambient.
- This parameter is specified but not tested.
- Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parametric tests. In any sequence of parameter tests, I<sub>OS</sub> tests should be performed last.
- Per TTL driven input; all other inputs at V<sub>CC</sub> or GND.
