FUNCTIONAL DIAGRAM

Octal Buffers/Line Drivers, 3-State

CD54/74FCT240, CD54/74FCT240AT - Inverting
CD54/74FCT241, CD54/74FCT241AT - Non-Inverting
CD54/74FCT244, CD54/74FCT244AT - Non-Inverting

Type Features:

- Buffered inputs
- Typical propagation delay:
 4.1ns @ $V_{CC} = 5V, T_A = +25^{\circ}C, C_L = 50pF$ (FCT240AT, FCT244AT)

The CD54/74FCT240, 240AT, 241, 241AT, 244 and 244AT 3-state octal buffers/line drivers use a small-geometry BiCMOS technology. The output stage is a combination of bipolar and CMOS transistors that limits the output-HIGH level to two diode drops below V_{CC} . This resultant lowering of output swing (0V to 3.7V) reduces power bus ringing (a source of EMI) and minimizes V_{CC} bounce and ground bounce and their effects during simultaneous output switching. The output configuration also enhances switching speed and is capable of sinking 48 to 64 milliamperes.

The CD54/74FCT240, 240AT, 244 and 244AT have active-LOW output enables ($\overline{1OE}$, $\overline{2OE}$). The CD54/74FCT241 and CD54/74FCT241AT have one active-LOW ($\overline{1OE}$) and one active-HIGH (2OE) output enable.

The CD54/74FCT240, 240AT, 241, 241AT, 244 and 244AT are supplied in 20-lead dual-in-line plastic packages (E suffix) and in 20-lead dual-in-line small-outline plastic packages (M suffix). Both package types are operable over two temperature ranges: Commercial (0°C to +70°C) and Extended Industrial (-55°C to +125°C).

Family Features:

- SCR-latchup-resistant BiCMOS process and circuit design
- FCTXXX Types - Speed of bipolar FAST*/AS/S;
- FCTXXXAT Types - 30% faster than FAST/AS/S with significantly reduced power consumption
- 64/48-mA output sink current (commercial/extended industrial)
- Output voltage swing limited to 3.7V @ $V_{CC} = 5V$
- Controlled output-edge rates
- Input/output isolation to V_{CC}
- BiCMOS technology with low quiescent power

* FAST is a registered trademark of Fairchild Semiconductor Corp.

The CD54FCT240, 241 and 244 are also available in chip form (H suffix). These unpackaged devices are operable over the -55°C to +125°C temperature range.

§ C_{PD} , measured per function, is used to determine the dynamic power consumption. P_D (per package) = $V_{CC} I_{CC} + \Sigma (V_{CC}^2 f_i C_{PD} + V_O^2 f_o C_L + V_{CC} \Delta I_{CC})$ where: V_{CC} = supply voltage ΔI_{CC} = flow through current x unit load C_L = output load capacitance

D = duty cycle of input high

 f_o = output frequency f_i = input frequency

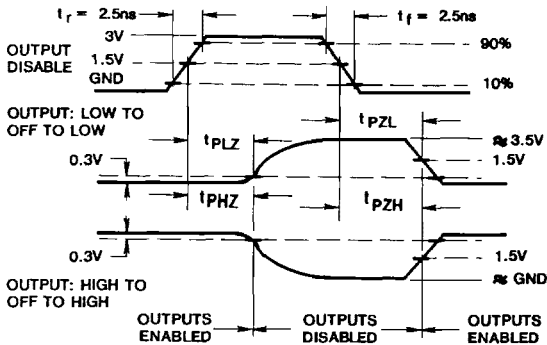

PARAMETER MEASUREMENT INFORMATION

NOTES:

1. VOLP is measured with respect to a ground reference near the output under test. VOHV is measured with respect to VOH.
2. Input pulses have the following characteristics:
 PRR ≤ 1MHz, $t_r = 2.5ns$, $t_f = 2.5ns$, skew 1ns.
3. R.F. fixture with 700-MHz design rules required. IC should be soldered into test board and bypassed with 0.1μF capacitor. Scope and probes require 700-MHz bandwidth.
