

Low-Noise, High PSRR, Low-Dropout, 120mA Linear Regulator

MAX8940

General Description

The MAX8940 low-noise, low-dropout (LDO) linear regulator is designed to deliver up to 120mA continuous output current. This regulator achieves a low 120mV dropout for 120mA load current. The MAX8940 uses an advanced architecture to achieve low output voltage noise of 25 μ V_{RMS} and PSRR of 45dB at 100kHz.

The MAX8940 is preset to either 2.8V or 3.0V. Designed with a p-channel MOSFET series pass transistor, the MAX8940 maintain very low ground current (40 μ A).

The regulator is designed and optimized to work with low-value, low-cost ceramic capacitors. The MAX8940 requires only 1 μ F (typ) of output capacitance for stability with any load. When disabled, current consumption drops to below 1 μ A.

Package is a 5-pin SC70.

Applications

Cellular and Cordless Phones
PDA and Palmtop Computers
Base Stations
Bluetooth Portable Radios and Accessories
Wireless LANs
Digital Cameras
Personal Stereos
Portable and Battery-Powered Equipment

Pin Configuration

Features

- ◆ Space-Saving SC70
- ◆ 25 μ V_{RMS} Output Noise at 100Hz to 100kHz Bandwidth
- ◆ 65dB PSRR at 10kHz
- ◆ 120mV Dropout at 120mA Load
- ◆ Stable with 1 μ F Ceramic Capacitor for Any Load
- ◆ Guaranteed 120mA Output
- ◆ Output Voltages: 2.8V or 3V
- ◆ Low 40 μ A Ground Current
- ◆ Excellent Load/Line Transient
- ◆ Overcurrent and Thermal Protection

Ordering Information

Typical Operating Circuit

Low-Noise, High PSRR, Low-Dropout, 120mA Linear Regulator

ABSOLUTE MAXIMUM RATINGS

IN to GND	-0.3V to +7V	θ_{JA}	324°C/W
Output Short-Circuit Duration	Infinite	5-Pin SC70	324°C/W
OUT, \overline{SHDN} to GND	-0.3V to (IN + 0.3V)	Operating Temperature Range	-40°C to +85°C
FB, BP, N.C. to GND	-0.3V to (OUT + 0.3V)	Junction Temperature	+150°C
Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)		Storage Temperature Range	-65°C to +150°C
5-Pin SC70 (derate 3.1mW/°C above +70°C)	0.247W	Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

($V_{IN} = V_{OUT} + 0.5\text{V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, unless otherwise noted. $C_{IN} = 1\mu\text{F}$, $C_{OUT} = 1\mu\text{F}$, $C_{BP} = 10\text{nF}$. Typical values are at $+25^\circ\text{C}$; the MAX8940 is tested with 2.45V output, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

Pin Description

PIN	NAME	FUNCTION
1	IN	Unregulated Input Supply
2	GND	Ground
3	$\overline{\text{SHDN}}$	Shutdown. Pull low to disable the regulator.
4	BP	Noise Bypass for Low-Noise Operation. Connect a 10nF capacitor from BP to OUT. It is short to OUT in shutdown mode.
5	OUT	Regulated Output Voltage. Bypass with a capacitor to GND. See the <i>Capacitor Selection and Regulator Stability</i> section for more details.

Detailed Description

The MAX8940 is a low-noise, low-dropout, low-quiescent current linear regulator designed for space-restricted applications. The part is available with preset output voltages 2.8V or 3.0V. This device can supply loads up to 120mA. As shown in the *Functional Diagram*, the MAX8940 consist of an innovative bandgap core and noise bypass circuit, error amplifier, p-channel pass transistor, and internal feedback voltage-divider.

The 1.225V bandgap reference is connected to the error amplifier's inverting input. The error amplifier compares this reference with the feedback voltage and amplifies the difference. If the feedback voltage is lower than the reference voltage, the pass-transistor gate is pulled low. This allows more current to pass to the output and increases the output voltage. If the feedback voltage is too high, the pass transistor gate is pulled high, allowing less current to pass to the output. The output voltage is fed back through an internal resistor voltage-divider connected to the OUT pin.

An external bypass capacitor connected to BP reduces noise at the output. Additional blocks include a current limiter, thermal sensor, and shutdown logic.

Internal P-Channel Pass Transistor

The MAX8940 features a 1 Ω (typ) p-channel MOSFET pass transistor. This provides several advantages over similar designs using a PNP pass transistor, including longer battery life. The p-channel MOSFET requires no base drive, which considerably reduces quiescent current. PNP-based regulators waste considerable current in dropout when the pass transistor saturates. They also use high base-drive current under heavy loads. The MAX8940 does not suffer from these problems and

consume only 40 μ A of quiescent current in light load and 220 μ A in dropout (see the *Typical Operating Characteristics*).

Shutdown

The MAX8940 features a low-power shutdown mode that reduces quiescent current less than 1 μ A. Driving $\overline{\text{SHDN}}$ low disables the voltage reference, error amplifier, gate-drive circuitry, and pass transistor (see the *Functional Diagram*), and the device output enters a high-impedance state. Connect $\overline{\text{SHDN}}$ to IN for normal operation.

Current Limit

The MAX8940 includes a current limiter, which monitors and controls the pass transistor's gate voltage, limiting the output current to 200mA. For design purposes, consider the current limit to be 130mA (min) to 300mA (max). The output can be shorted to ground for an indefinite amount of time without damaging the part.

Thermal-Overload Protection

Thermal-overload protection limits total power dissipation in the MAX8940. When the junction temperature exceeds $T_J = +160^\circ\text{C}$, the thermal sensor signals the shutdown logic, turning off the pass transistor and allowing the IC to cool down. The thermal sensor turns the pass transistor on again after the IC's junction temperature drops by 10 $^\circ\text{C}$, resulting in a pulsed output during continuous thermal-overload conditions.

Thermal-overload protection is designed to protect the MAX8940 in the event of a fault condition. For continual operation, do not exceed the absolute maximum junction temperature rating of $T_J = +150^\circ\text{C}$.

Operating Region and Power Dissipation

The MAX8940 maximum power dissipation depends on the thermal resistance of the case and circuit board,

Low-Noise, High PSRR, Low-Dropout, 120mA Linear Regulator

MAX8940

the temperature difference between the die junction and ambient, and the rate of airflow. The power dissipation across the device is:

$$P = I_{OUT} (V_{IN} - V_{OUT})$$

The maximum power dissipation is:

$$P_{MAX} = (T_J - T_A) / (\theta_{JC} + \theta_{CA})$$

where $T_J - T_A$ is the temperature difference between the MAX8940 die junction and the surrounding air, θ_{JC} is the thermal resistance of the package, and θ_{CA} is the thermal resistance through the PC board, copper traces, and other materials to the surrounding air.

The GND pin of the MAX8940 performs the dual function of providing an electrical connection to ground and channeling heat away. Connect the GND pin to ground using a large pad or ground plane.

Noise Reduction

For the MAX8940, an external 0.01 μ F bypass capacitor between BP and OUT with innovative noise bypass scheme reduces output noises dramatically, exhibiting 25 μ V_{RMS} of output voltage noise with $C_{BP} = 0.01\mu$ F and $C_{OUT} = 1\mu$ F. Startup time is minimized by a power-on circuit that precharges the bypass capacitor.

Applications Information

Capacitor Selection and Regulator Stability

Use a 1 μ F capacitor on the MAX8940 input and a 1 μ F capacitor on the output. Larger input capacitor values and lower ESRs provide better noise rejection and line-transient response. Reduce output noise and improve load-transient response, stability, and power-supply rejection by using large output capacitors. Note that some ceramic dielectrics exhibit large capacitance and

ESR variation with temperature. With dielectrics such as Z5U and Y5V, it may be necessary to use a 2.2 μ F or larger output capacitor to ensure stability at temperatures below -10°C. With X7R or X5R dielectrics, 1 μ F is sufficient at all operating temperatures. A graph of the region of stable C_{OUT} ESR vs. load current is shown in the *Typical Operating Characteristics*.

Use a 0.01 μ F bypass capacitor at BP for low-output voltage noise. The leakage current going into the BP pin should be less than 10nA. Increasing the capacitance slightly decreases the output noise. Values above 0.1 μ F and below 0.001 μ F are not recommended.

Noise, PSRR, and Transient Response

The MAX8940 is designed to deliver low noise and high PSRR, as well as low dropout and low quiescent currents in battery-powered systems. The MAX8940 power-supply rejection is 65dB at 1kHz.

When operating from sources other than batteries, improved supply-noise rejection and transient response can be achieved by increasing the values of the input and output bypass capacitors, and through passive filtering techniques. The *Typical Operating Characteristics* show the MAX8940 line- and load-transient responses.

Dropout Voltage

A regulator's minimum dropout voltage determines the lowest usable supply voltage. In battery-powered systems, this determines the useful end-of-life battery voltage. Because the MAX8940 uses a p-channel MOSFET pass transistor, the dropout voltage is a function of drain-to-source on-resistance ($R_{DS(ON)}$) multiplied by the load current (see the *Typical Operating Characteristics*).
