

USER GUIDE

Introduction

This User Guide introduces the Evaluation Kit and describes the development and debugging capabilities running on Atmel® | SMART SAM9 ARM®-based Embedded MPUs as listed below:

- SAM9G15
- SAM9G25
- SAM9X25
- SAM9G35
- SAM9X35

The User Guide pertains to the following Evaluation Kit references:

- SAM9G15-EK
- SAM9G25-EK
- SAM9X25-EK
- SAM9G35-EK
- SAM9X35-EK

Contents

- Board
 - One EK board
 - One of the five available CPU modules (CM)
 - SAM9G15-CM
 - SAM9G35-CM
 - SAM9X35-CM
 - SAM9G25-CM
 - SAM9X25-CM
 - One optional DM board featured in SAM9G15, SAM9G35, SAM9X35 kits only.
- Power supply
 - Universal input AC/DC power supply with US, Europe and UK plug adapters
 - One 3V Lithium Battery type CR1225
- Cables
 - One serial RS232 cable
 - One micro A/B-type USB cable
 - One RJ45 crossed cable
- A Welcome Letter

Board Photo (Display module is optional)

1. Specifications

1.1 Kit Specifications

Unpack and inspect the kit carefully. Contact your local Atmel distributor, should there be issues concerning the contents of the kit.

Figure 1-1. Unpacked Evaluation Kit

1.2 Board Specifications

Table 1-1. Evaluation Kit Specifications

| Characteristics | Specifications |
|---|---|
| Clock speed | 400 MHz PCK, 133 MHz MCK |
| Ports | Ethernet, USB, RS232, DBGU, JTAG, CAN, Audio, SD Card |
| Board supply voltage | 5 VDC from connector |
| Temperature - operating - storage | -10° to +50° C -40° to +85° C |
| Relative humidity | 0 to 90% (non condensing) |
| Dimensions | 165 mm x 135 mm |
| EK (Evaluation Kit) | 67.6 mm x 35 mm |
| CM (Computer Module) | 135 mm x 80 mm |
| DM (Display Module) | |
| RoHS status | Compliant |

2. Power Up

2.1 Power Up the Board

Unpack the board taking care to avoid electrostatic discharge. Unpack the power supply, select the right power plug adapter corresponding to that of your country, and insert it in the power supply.

Connect the power supply DC connector to the board and plug the power supply to an AC power plug.

For SAM9G15, SAM9G35, SAM9X35 kits which contain LCD, the screen should light up and display the welcome page of a graphic demo. Click or touch icons displayed on the screen and enjoy the demo.

For SAM9G25 and SAM9X25 which do not contain LCD, before power up, connect DBGU port J11 on the EK board (refer to [Section 3.3.3.4](#) for details) to RS232 port on your computer through the RS232 cable provided with the kit. It is recommended to open a communication session under HyperTerminal. After power up, a command-line based demo runs that can be monitored on HyperTerminal window.

2.2 Sample Code and Technical Support

After boot up, designers can run sample code or their own application, on the development kit. Users can download sample code and get technical support from the Atmel web site:

http://www.atmel.com/products/at91/default.asp?category_id=163&family_id=605&source=global_nav

Figure 2-1. Atmel Web Site

Note: Different interfaces on the EK boards share the same connections to the CPU module. Therefore the actual usage depends on the CPU module featured in the evaluation kit.

2.3 Recovery Procedure

All EK boards have passed strict test procedures before shipment. These test procedures are contained in the SPI serial Flash in case users need to examine the boards again at any time.

If the contents of the SPI serial Flash have been deleted, follow the instructions below to recover the state as it was when shipped by Atmel.

1. Go to the page on atmel.com for the EK being used.
2. Locate the EK Design & Manufacturing Files as shown in [Figure 2-2](#).
3. Find the *xxx-EK_test_12_public.zip*, which is the file for Flash content burning.
4. Follow the step-by-step instructions in the file *SAM9X5_EK_Test_Software* to recover the content and to test each section of the boards.

Figure 2-2. EK Design & Manufacturing Files

Home > Microcontrollers > Atmel ARM-based Solutions > Atmel SAM9G > SAM9G15-EK

SAM9G15-EK

The screenshot shows a product page for the SAM9G15-EK evaluation kit. At the top, there is a navigation bar with tabs: Overview, Devices, Documents (which is highlighted in blue), Applications, and Related Tools. Below the navigation bar is a large image of the SAM9G15-EK board, which features the Atmel logo and the text "AT91SAM". Under the image, the word "Documents" is displayed. Below "Documents" are three download links: "PDF", "Software Description", and a link to the "SAM9G15-EK Design & Manufacturing Files (Other)". The "SAM9G15-EK Design & Manufacturing Files (Other)" link is described as a bundle containing all the schematics, PCB and test files for all the kit versions.

Bundle containing all the schematics, PCB and test files for all the kit versions.

3. Hardware Overview

3.1 Introduction

The Evaluation Kit is a fully-featured evaluation platform for the Atmel MPU. The Evaluation Kit enables users to extensively evaluate, prototype and create application-specific designs.

The Evaluation Kit is a new platform architecture based on a Main Board (MB), a CPU Module (CM) equipped with one of the five processors and an optional Display Module (DM).

The Evaluation Kit consists of three boards:

1. The CPU Module (CM) board, is a single-board computer that integrates all the core components and is mounted onto an application-specific carrier board (EK board). The CPU Module has specified pinouts based on the SODIMM200 connector. It provides the functional requirements for an embedded application. These functions include, but are not limited to, graphics, audio, mass storage, network and multiple serial and USB ports. A single SODIMM200 connector provides an interface for the carrier board to carry all the I/O signals to and from the CPU Module.
2. The Evaluation Kit board (EK Main Board) provides all the interface connectors required to attach the system to the application specific peripherals. This versatility allows the designer to create a densely packed solution, which results in a more reliable product while simplifying system integration.
3. The optional Display Module (DM) board integrates LCD, TouchScreen and QTouch® technology.

[Table 3-1](#) lists the features provided on the Evaluation Kit:

Table 3-1. Evaluation Kit Features

| Supported Modules | | Product Name | | | | | |

3.2 Computer Module (CM)

3.2.1 CM Board Overview

The CM board is the CPU module at the heart of the system. It connects to the EK board through a SO-DIMM200 interface. It carries the processor and external memories. The CM board serves as a minimal CPU sub-system. All five processors: SAM9G15, SAM9G25, SAM9X25, SAM9G35 and SAM9X35 share the same CM circuitry with minor configuration settings.

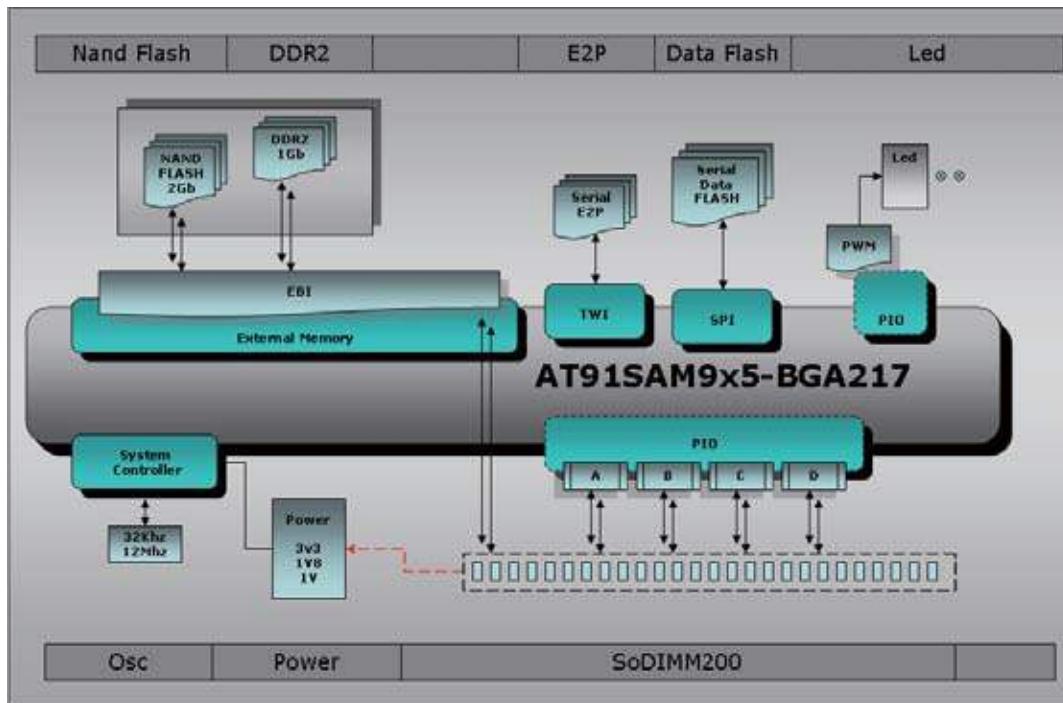

Note: There are three CM boards from three different manufacturers. The five processors are implemented as shown in [Table 3-2](#) below:

Table 3-2. CM Board Implementation

| Manufacturer & Module kind | SAM9G15-CM | SAM9G25-CM | SAM9G35-CM | SAM9X25-CM | SAM9X35-CM |
|----------------------------|------------|------------|------------|------------|------------|
| mfg 1 | x | - | x | - | - |
| mfg 2 | - | - | - | x | x |
| mfg 3 | x | x | x | x | x |

The three CM boards share the same circuitry design but with different designator information and PCB layouts. The circuitry reference in this guide, for common design parts, refers to schematics from SAM9G25-CM (mfg 3). All the other schematics are provided in [Section 3.2.6 "Schematics"](#).

Figure 3-1. Board Architecture

3.2.2 Equipment List

The CM board is built around the integration of an ARM926-based microcontroller (BGA217 package) with external memory and optional Ethernet PHYsical Layer Transceiver.

3.2.2.1 Devices

Following is the list of the CM board components:

- One SAM9 Embedded MPU from the list below
 - SAM9G15
 - SAM9G25
 - SAM9G35
 - SAM9X25
 - SAM9X35
- 12 MHz crystal
- 32.768 KHz crystal
- 1 Gbit DDR2 memory
- 2 Gits NAND Flash memory with Chip Selection control switch
- 32 Mbits SPI Serial Flash with Chip Selection control switch
- 512 Kbits EEPROM
- 1 Kbyte 1-Wire EEPROM
- On-board power regulation
- Two user LEDs
- Optional PHY

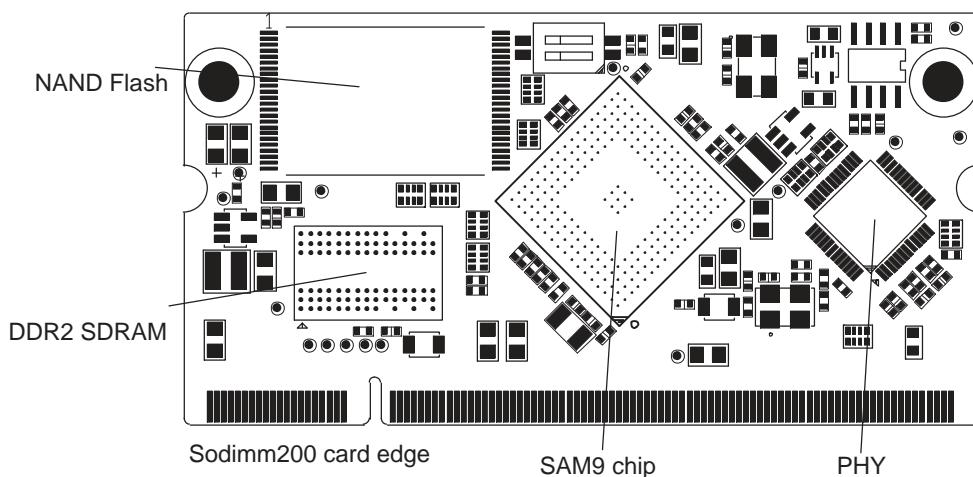

3.2.2.2 Interface Connection

- SODIMM200 card edge interface

3.2.2.3 Configuration Items

- Dual ON/OFF switch for NAND Flash and SPI serial Flash Chip Select connection

Figure 3-2. CM Board Layout Commented

3.2.3 Function Blocks

3.2.3.1 Processor

The CM Board is equipped with an Atmel ARM-based embedded MPU, as listed below, in a 217-ball BGA package. The five devices share an identical footprint. All five share the same CM Board PCB with minor configuration differences.

The five devices are:

- SAM9G15
- SAM9G25
- SAM9G35
- SAM9X25
- SAM9X35

As different interfaces can be defined using the same pins, it depends on the actual configuration of the CPU as to which functions are in fact available to the EK board.

Refer to [Section 3.2.4.1 "Chip Identification"](#) for details. The processor runs at a nominal frequency of 400 MHz for the core and 133 MHz for the system bus.

The peripheral configuration possibilities and implementation requirements of the CM are dependent on the module's chipset. Two configuration resistors are implemented on board in order to select the mode of configuration.

3.2.3.2 Clock Circuitry

The CM includes 3 clock sources:

- Two are alternatives for the processor main clock
- One crystal and one crystal oscillator are used for the Ethernet MII/RMII chip

Table 3-3. Main Components Associated with the Clock Systems

| Quantity | Description | Component assignment |
|----------|--|----------------------|
| 1 | Crystal for Internal Clock, 12 MHz | Y1 |
| 1 | Crystal for RTC Clock, 32.768 kHz | Y2 |
| 1 | Oscillator for Ethernet Clock RMII, 50 MHz | Y3 |

3.2.3.3 Reset Circuitry

The reset sources for the CM board are:

- Power on reset
- Push button reset (Push button is equipped on EK board)
- JTAG reset from an in-circuit emulator (JTAG interface is equipped on EK board)

3.2.3.4 Power Supplies

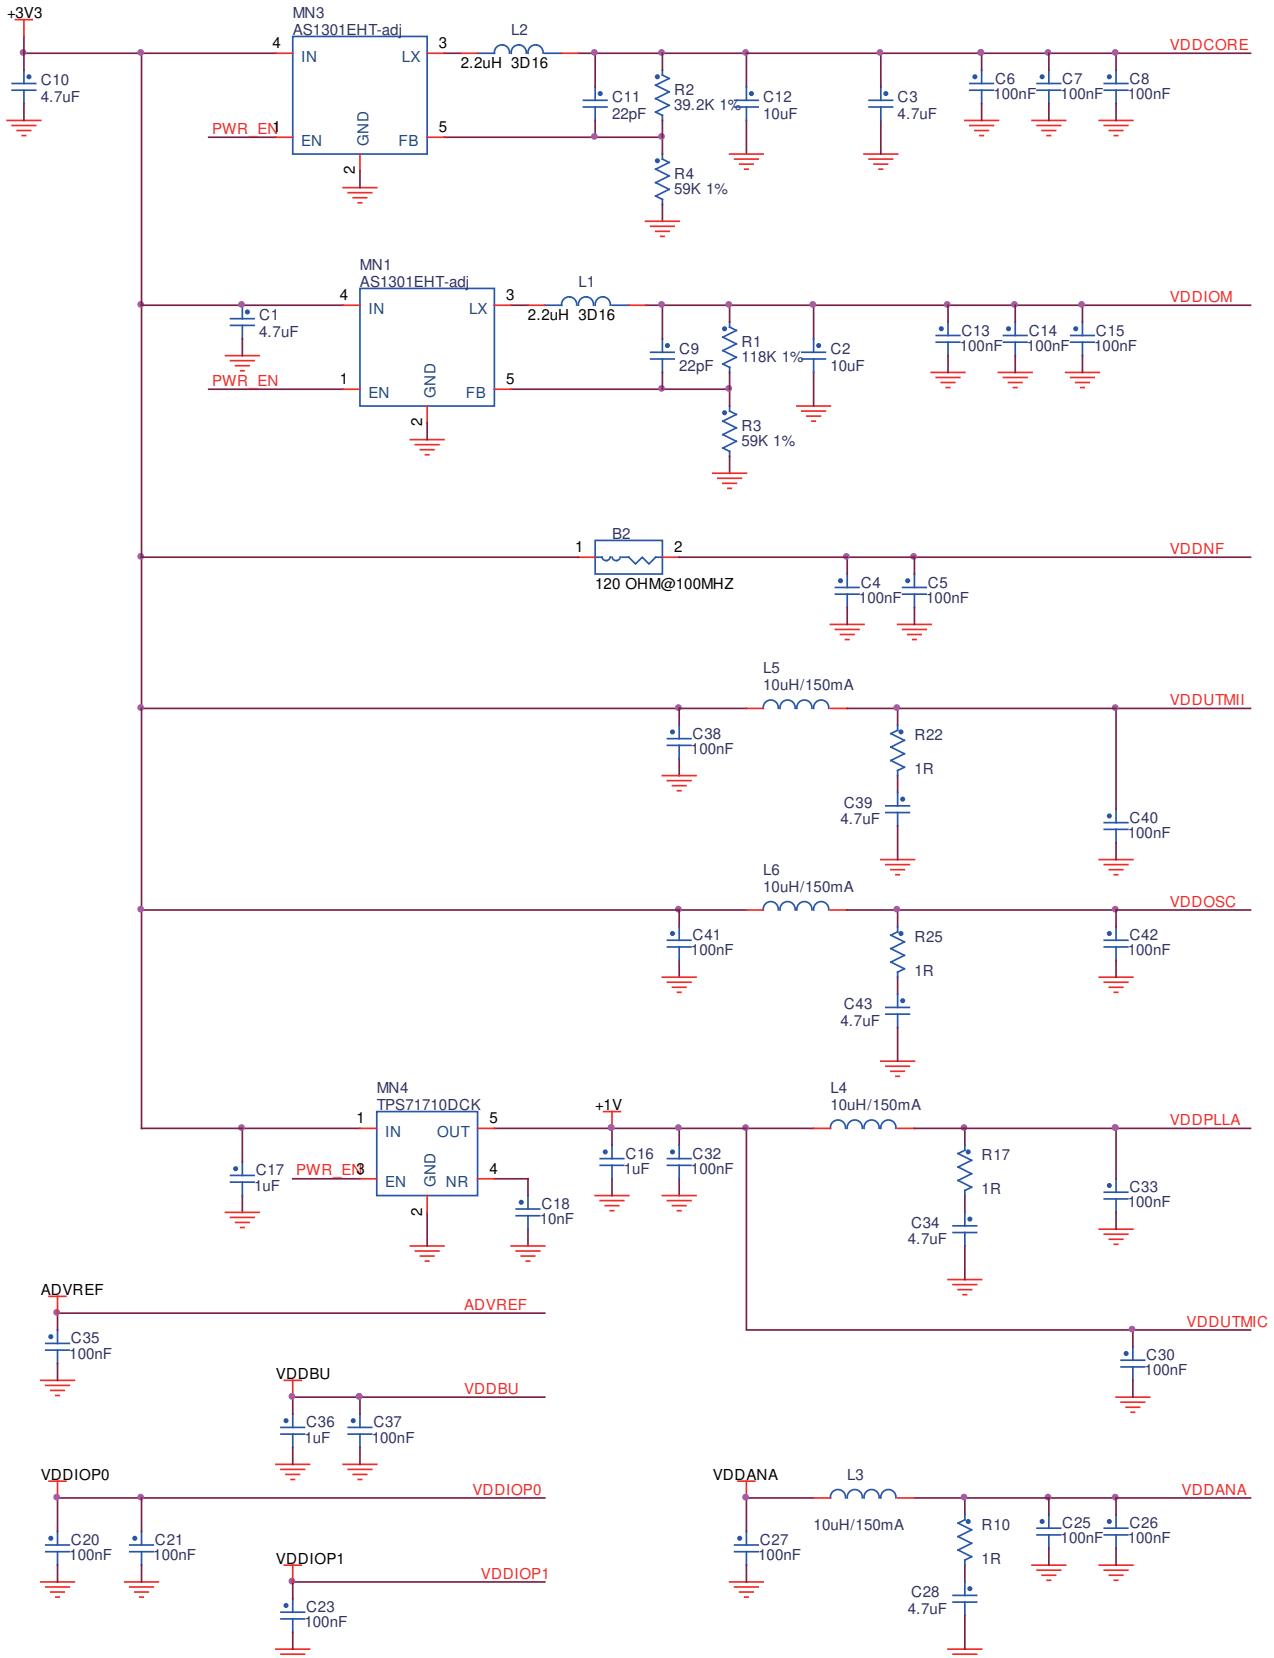

The CM Board is driven by +3V3 input power rail from the EK board through the SODIMM200 connector. The CM Board embeds all the necessary power rails required for the micro processor.

When additional voltages are required, for example VDDCORE, they are generated on board from the 3.3V supply. The detailed power supply requirements for any given module are specified within the corresponding product documentation. The following table summarizes the power specifications.

Table 3-4. Power Rails Associated with the Systems

| Nominal | Name | Powers | Component |
|------------------------------|------------|---|--------------------------|
| 3.3v | VDDNF | the NAND Flash I/O and control, D16-D32 and multiplexed SMC lines | From SODIMM200 connector |
| 3.3v | VDDIOP0 | Partial Peripheral I/O lines | From SODIMM200 connector |
| 3.3v | VDDIOP1 | Partial Peripheral I/O lines | From SODIMM200 connector |
| 3.0v | VDBBU | the Slow Clock oscillator, the internal 32 kHz RC, the internal 12 MHz RC and a part of the System Controller | From SODIMM200 connector |
| 3.3v | VDDUTMII | the USB device and host UTMI+ interface | From SODIMM200 connector |
| 3.3v | VDDOSC | the Main Oscillator cells | From SODIMM200 connector |
| 3.3v | VDDANA | the Analog to Digital Converter | From SODIMM200 connector |
| 1.8v | VDDIOM | the External Memory Interface I/O lines | on-board |
| 1.0v | VDDUTMIC | DC Supply UDPHS and UPHS UTMI+ Core | on-board |
| 3.3v | VDDPLLUTMI | DC Supply UDPHS and UPHS UTMI+ Interface | From SODIMM200 connector |
| 1.0v | VDDPLLA | the PLLA cell | on-board |
| 1.0v | VDDCORE | the core, including the processor, the embedded memories and the peripherals | on-board |
| 3.0V or 3.3V configurable | ADVREF | ADC Reference voltage | From SODIMM200 connector |

Figure 3-3. CM Power Supply

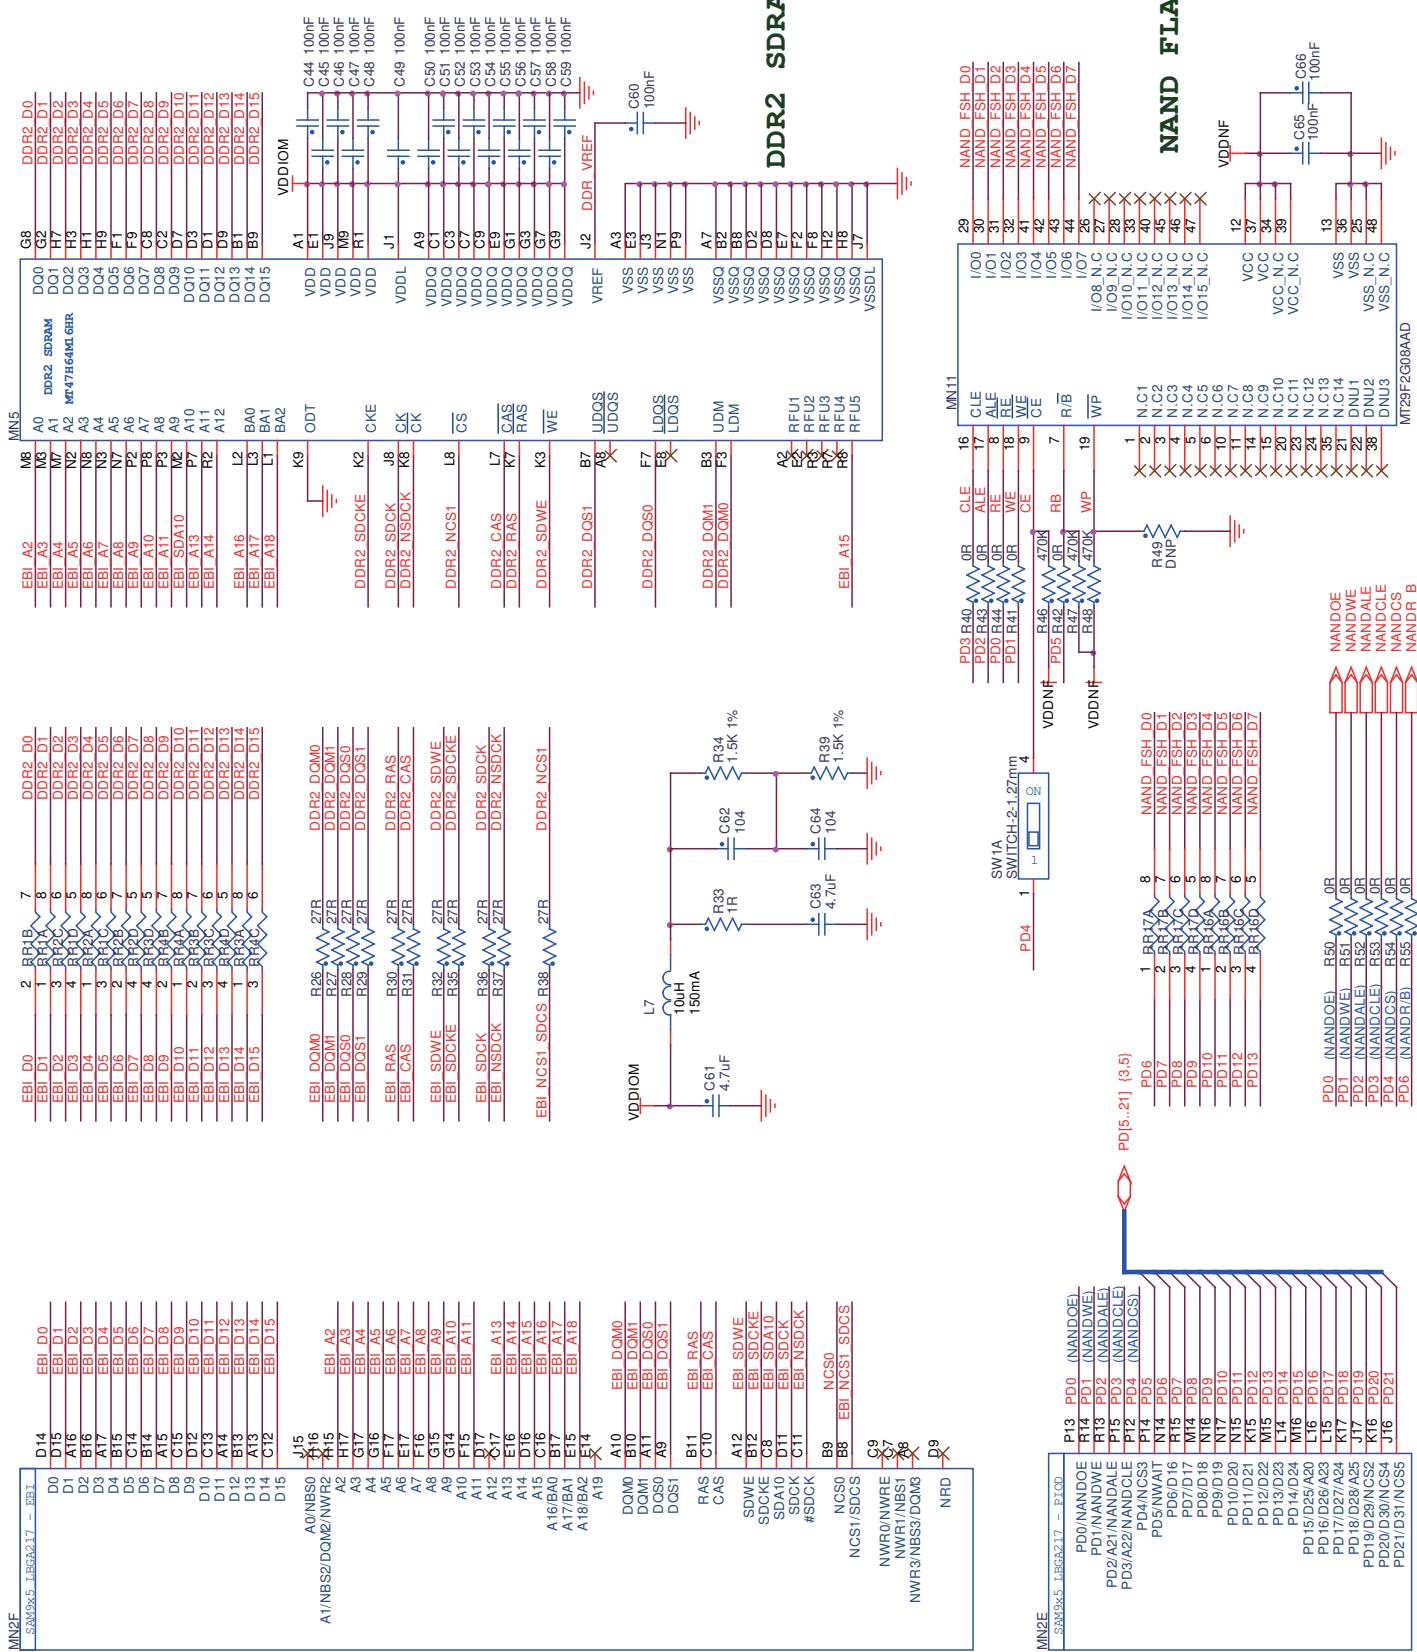

3.2.3.5 Memory

The Device serial processor features a DDR/SDR memory interface and an External Bus Interface (EBI) to enable interfacing to a wide range of external memories and to almost any kind of parallel peripheral.

The External Bus Interface (EBI) is connected to two kinds of memory devices:

- One 1 Gbyte DDR2 SDRAM
- One 2 Gbytes (or 4 Gbytes depending on supplier) NAND Flash

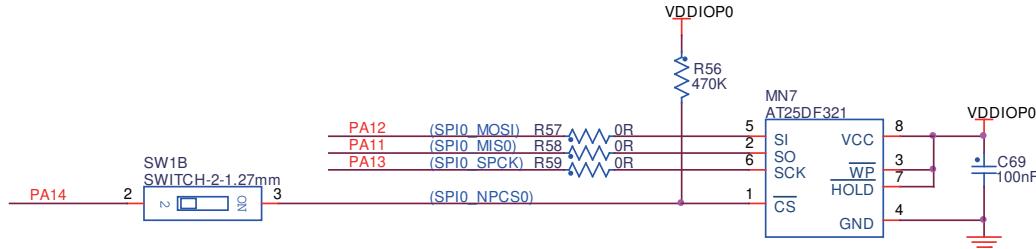

Figure 3-4. CM Board External Memory

3.2.3.6 Serial Peripheral Interface (SPI) Controller

The serial processor provides two high-speed Serial Peripheral Interface (SPI) controllers. One port is used to interface with the on-board serial Flash.

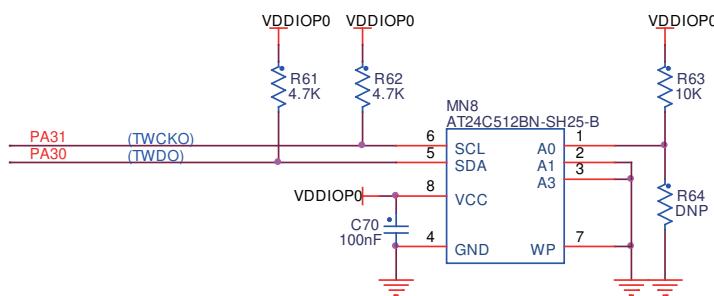

Figure 3-5. SPI

3.2.3.7 Two Wire Interface (TWI)

The serial processor has a full speed (400 kHz) master/slave TWI Serial Controller. The controller is mostly compatible with industry standard I²C and SMBus Interfaces. This port is used to interface with the on-board Serial EEPROM, ISI, QTouch device and audio codec interface.

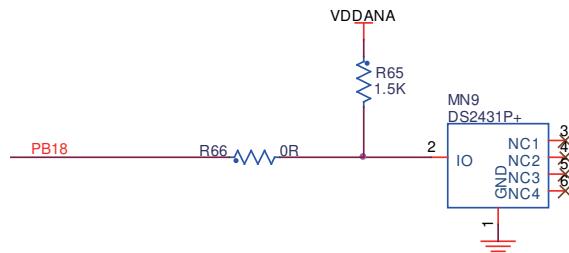

Figure 3-6. TWI

3.2.3.8 1-Wire EEPROM

The Evaluation Kit uses a 1-Wire device as “firmware label” to store the information such as chip type, manufacturer’s name, production date etc.

Figure 3-7. 1-Wire Device

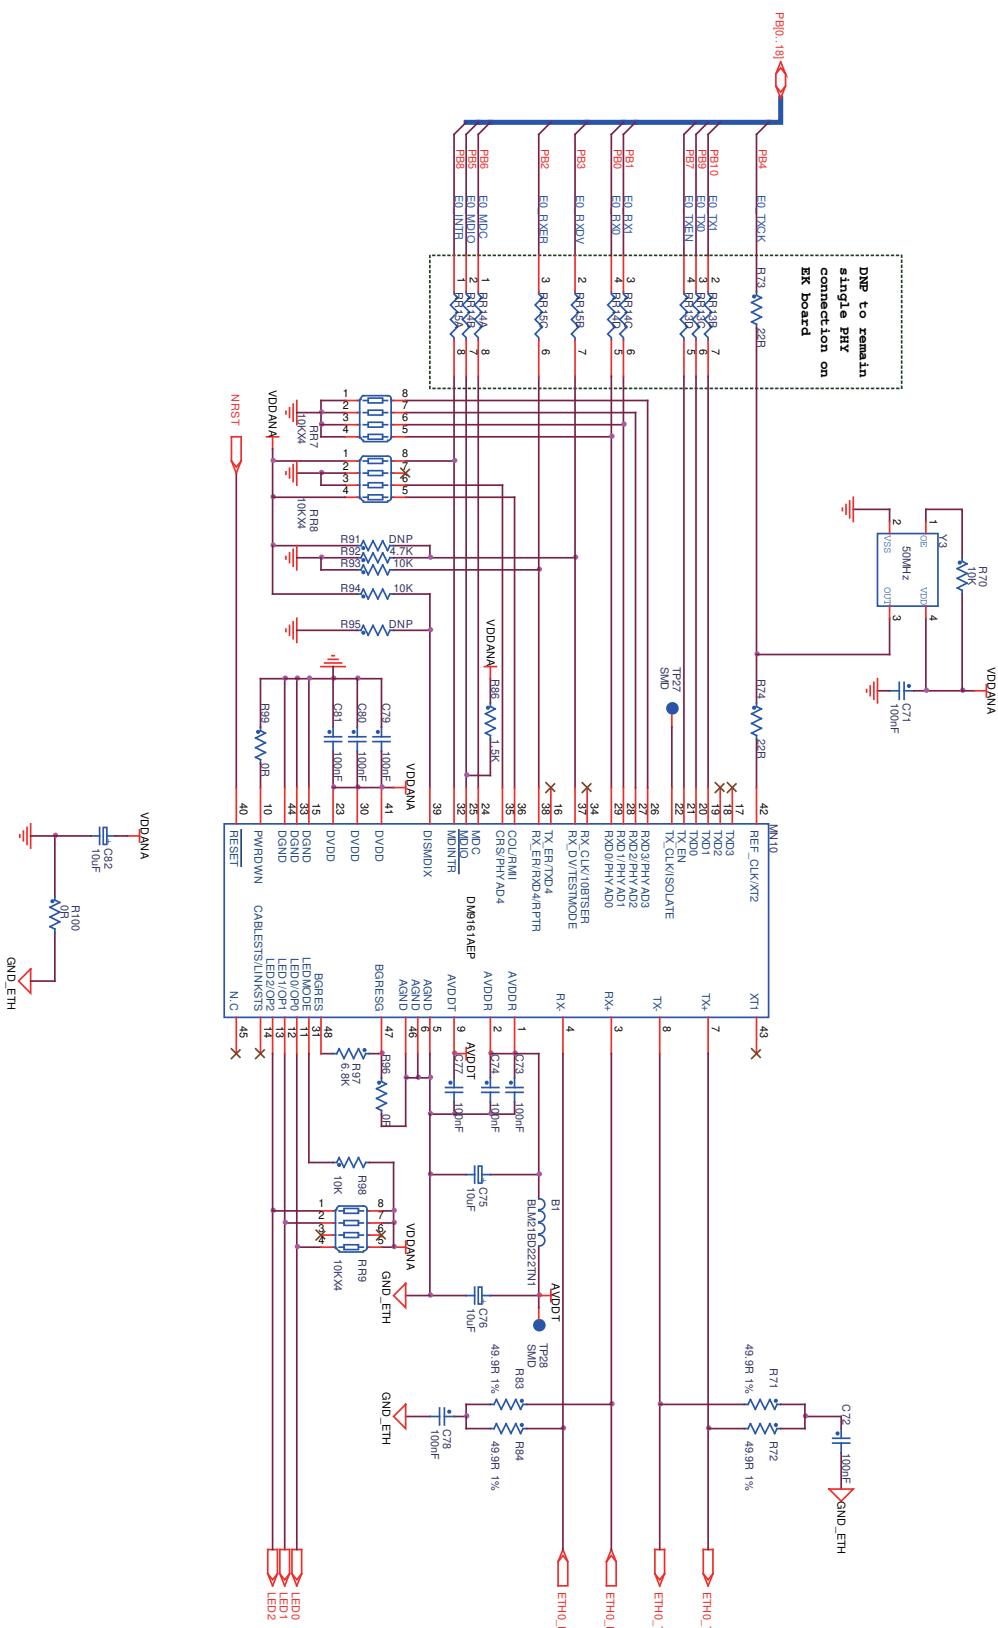

3.2.3.9 Optional PHY

Some of the device modules provide a location for a 10/100 Ethernet MAC/PHY interface.

For more information about the Ethernet controller device, refer to the Davicom DM9161 controller manufacturer’s datasheet.

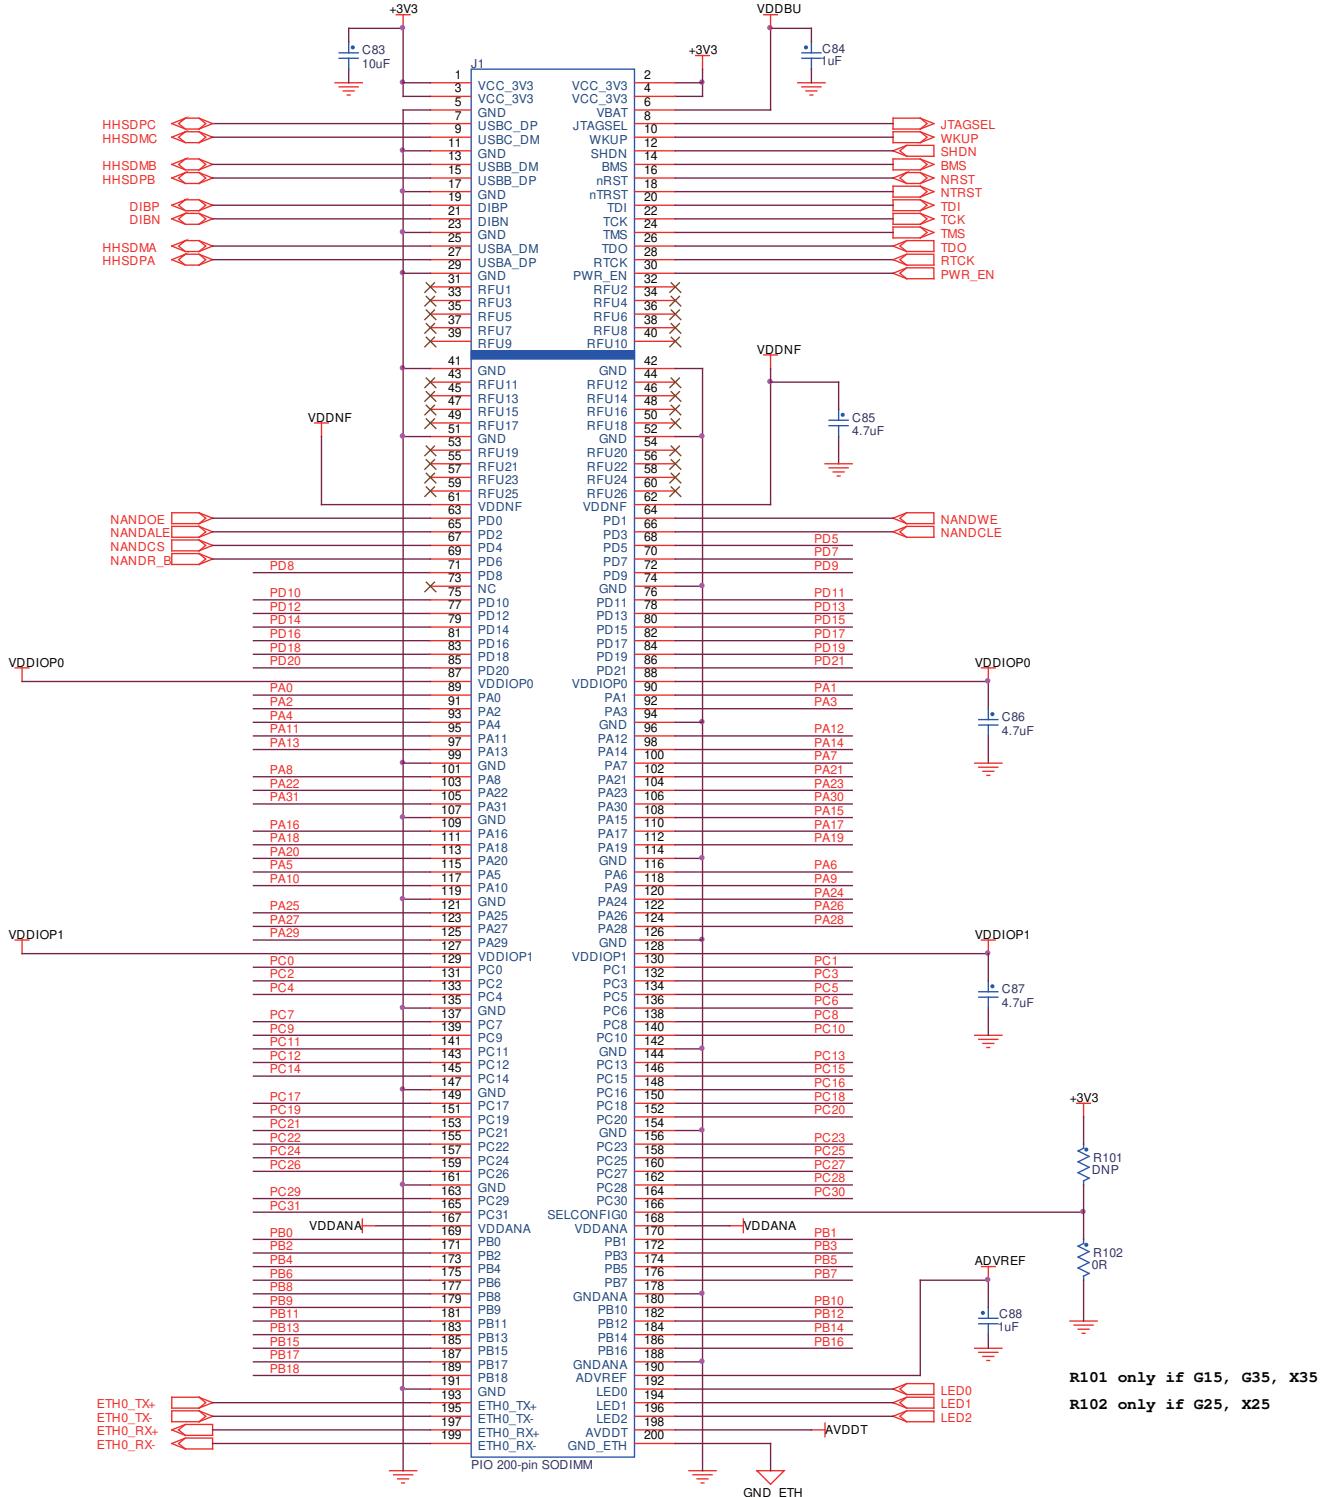

Figure 3-8. Ethernet

3.2.3.10 SODIMM200 Interface

The CM board uses SODIMM200 card edge connector to interface with the EK board.

Figure 3-9. SODIMM200 Interface on CM Board

3.2.4 Configuration

3.2.4.1 Chip Identification

The CM board may be equipped with any of the five processors, all sharing an identical BGA217 footprint. There are two resistors on the CM board for the purpose of identifying which of the five is the one actually mounted.

The tables below show in detail how the CM board, relative to different processors, determines the dedicated "SELCONFIG" logic.

Table 3-5. Resistor Identification

| Resistor | SAM9G15 | SAM9G25 | SAM9G35 | SAM9X25 | SAM9X35 |
|----------|---------------|---------------|---------------|---------------|---------------|
| R49 | – | – | – | Populated | Not Populated |
| R50 | – | – | – | Not Populated | Populated |
| R87 | Populated | – | Populated | – | – |
| R88 | Not Populated | – | Not Populated | – | – |
| R101 | Populated | Not Populated | Populated | Not Populated | Populated |
| R102 | Not Populated | Populated | Not Populated | Populated | Not Populated |

Table 3-6. Module Configuration Identification

| | | SAM9G15 module | SAM9G35 module | SAM9X35 module | SAM9G25 module | SAM9X25 module |
|------------|-------------------------------|----------------|----------------|----------------|----------------|----------------|
| CM Setting | R101 | Populated | Populated | Populated | Not Populated | Not Populated |
| | R102 | Not Populated | Not Populated | Not Populated | Populated | Populated |
| | SELCONFIG (SODIMM200 pin 166) | High | High | High | Low | Low |
| EK Setting | USART3 | Not Selected | Not Selected | Not Selected | Selected | Selected |
| | ETH1 | Not Selected | Not Selected | Not Selected | Not Selected | Selected |
| DM Setting | LCD | Selected | Selected | Selected | Not Selected | Not Selected |

3.2.4.2 Boot Configuration

In order to use the SAM-BA boot, users must ensure that JP9 (BMS configuration) on the board is open, so that the embedded ROM code runs and searches for a bootable device. For more details, refer to the product datasheet. To make the processor boot from SAM-BA, the external memory devices cannot be bootable.

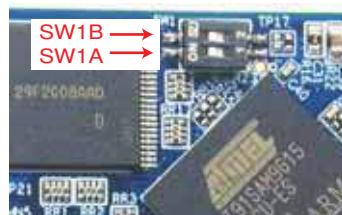

All three CM boards from different vendors feature a de-select function of the Chip Select signal on NAND and SPI serial Flash.

To boot from software, users may erase the bootable content within NAND and SPI serial Flash to launch a SAM-BA boot. A hardware disconnection of the Chip Select signal is not necessary.

Table 3-7. Boot Configuration

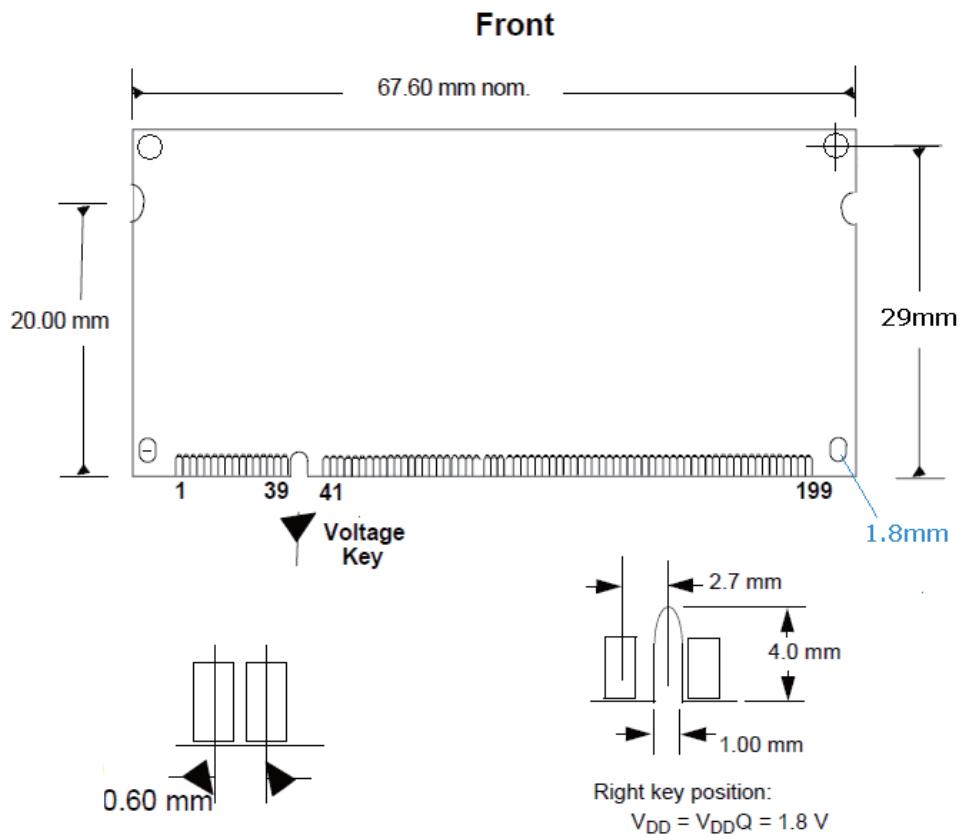

| Board Vendor | Designation | Default Setting | Feature |
|--------------|-------------|----------------------------|--|
| Embest CM | SW1A (1,4) | ON | 1. Default ON to select NAND Flash 2. Set to OFF to deselect the NAND Flash |
| | SW1B (2,3) | ON | 1. Default ON to select SPI serial Flash 2. Set to OFF to deselect the SPI serial Flash |
| Ronetix CM | J1 R17 | J1 DNP R17 populated | 1. Default select NAND Flash always 2. Users need to dismount R17, mount J1 as 2.54mm jumper to ease frequent changes 3. Close J1 to select NAND Flash Open J1 to deselect NAND Flash |
| | J2 R24 | J2 DNP R24 populated | 1. Default select SPI serial Flash always 2. Users need to dismount R24, mount J2 as 2.54mm jumper to ease frequent changes 3. Close J2 to select SPI serial Flash Open J2 to deselect SPI serial Flash |
| Cogent CM | P2 R90 | P2 normal close R90 DNP | 1. By default, P2 is closed to select NAND Flash 2. Open P2 to deselect NAND Flash 3. Mounting R90 as 0-ohm always selects NAND Flash |
| | R15 | R15 populated | 1. Default select SPI serial Flash always 2. Dismount R15 to deselect SPI serial Flash |

3.3 EK Board Description

3.3.1 EK Board Overview

The EK board serves as the main board that carries the CPU module. It features all necessary peripherals and interfaces for processor evaluation.

Figure 3-17. Commented EK Board Layout

3.3.2 Equipment List

Based on the processor installed on the CM board, the EK board is equipped with the following interfaces or peripherals:

3.3.2.1 Devices

List of the EK board peripherals:

- Two EMAC PHY
- One Audio codec
- Two high speed MCI Card interfaces
- Two CAN transceivers
- Three RS232 ports with level translator features: DBGU, USART0 and USART3
- One Smart DAA port
- Two USB host ports
- One USB host/device port
- On-board power regulation

- LCD/ISI extension interface
- ZigBee interface
- One-wire device

3.3.2.2 Board Interface Connection

- Main power supply (J4)
- One SODIMM200 socket (CON1)
- USB A Host/Device, support USB host/device using a type micro AB connector (J20)
- USB B Host, support USB host using a type A connector (J19, upper)
- USB C Host, support USB host using a type A connector (J19, lower)
- DBGU (RX and TX only) connected to a 9-way male RS232 connector (J11)
- USART1 (RX, TX, RTS, CTS) connected to a 9-way male RS232 connector (J8)
- USART3 (RX, TX, RTS, CTS) connected to a 9-way male RS232 connector (J12)
- JTAG, 20 pin IDC connector (J9)
- MicroSD connector (J6)
- SD/MMC connector (J7)
- Headphone (J15), line-in (J13)
- Image sensor connector (J21)
- DM board connection for QTouch and TFT LCD display with Touch Screen and backlight (J21, J22)
- DAA connecter RJ11 6P4C type (J16)
- CAN bus connectors RJ12 6P6C type (CON2, CON3)
- ZigBee connector (J10)
- Three IO expansion ports (J1, J2, J3)
- Test points, various test points are located throughout the board

3.3.2.3 Push Button Switches

- Reset, board reset (BP1)
- Wake up, push button to bring the processor out of low power mode (BP2)

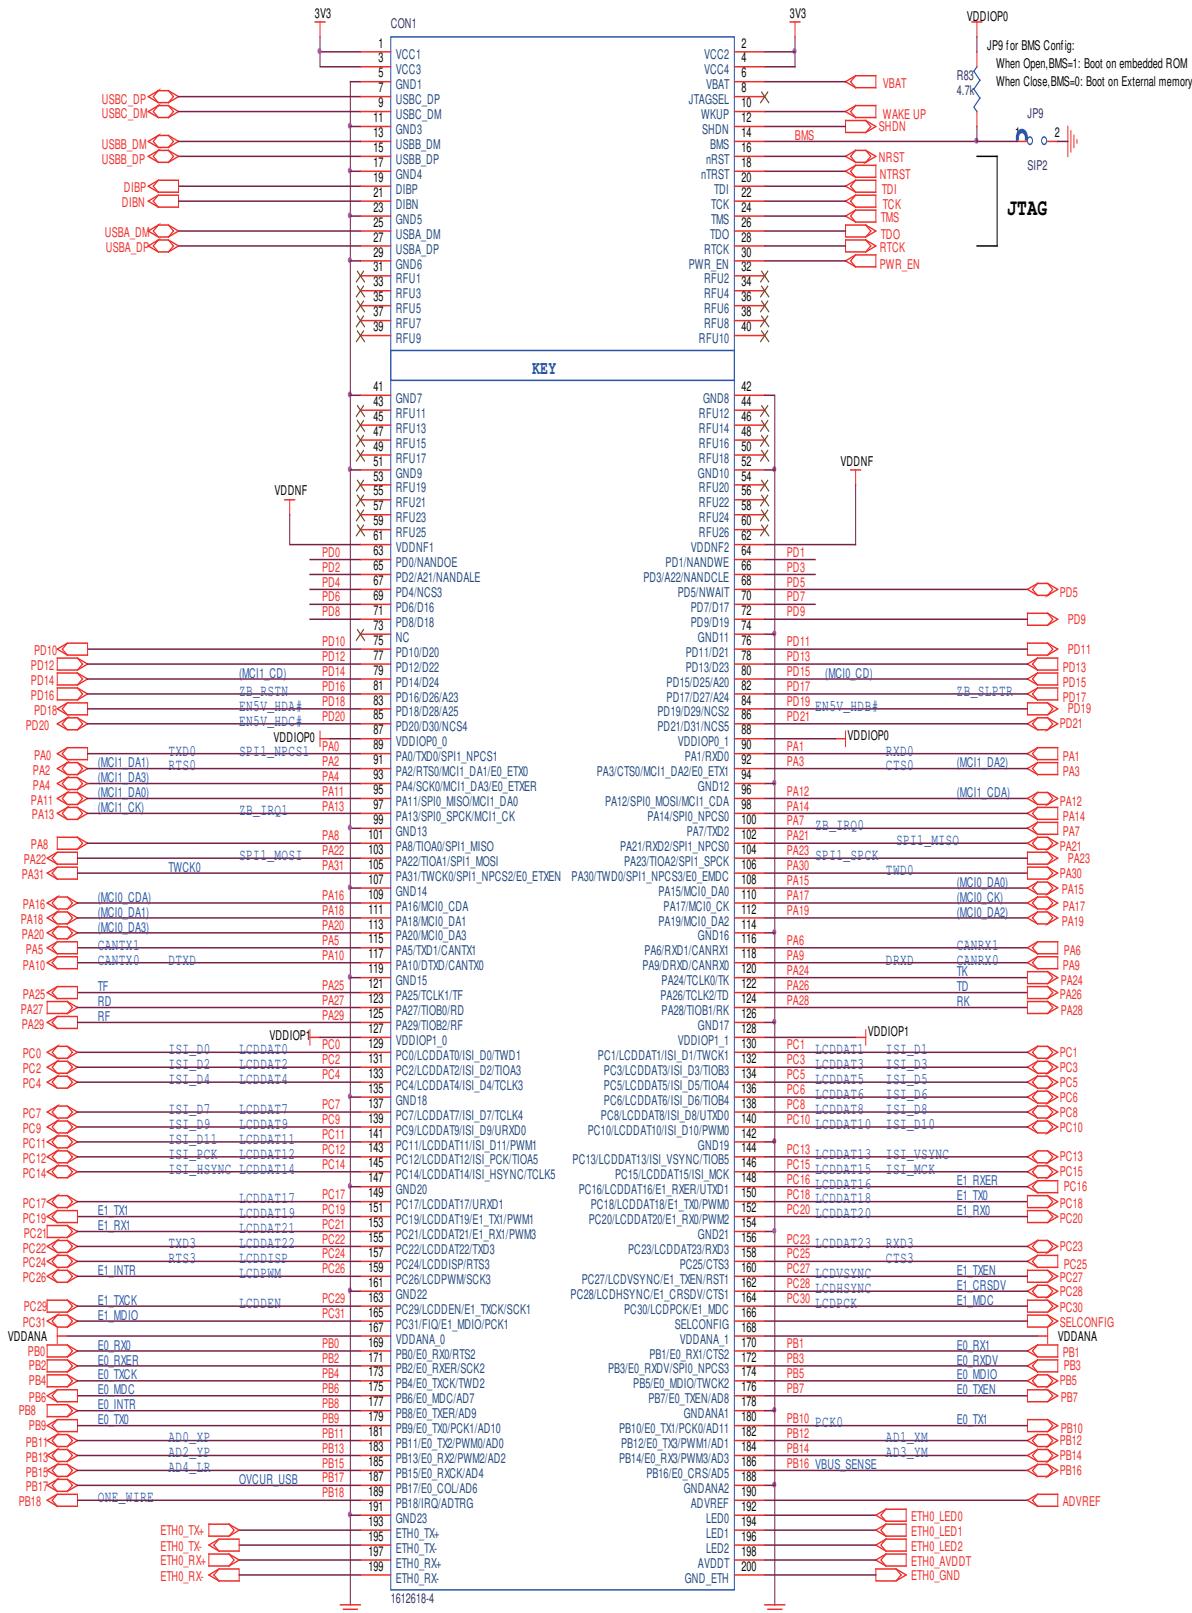

3.3.3 Function Blocks

3.3.3.1 Processor

The Evaluation Kit board may be used with any of the Core Modules:

- SAM9G15
- SAM9G25
- SAM9G35
- SAM9X25
- SAM9X35

Figure 3-18. SODIMM Interface on EK Board

3.3.3.2 Power Supplies

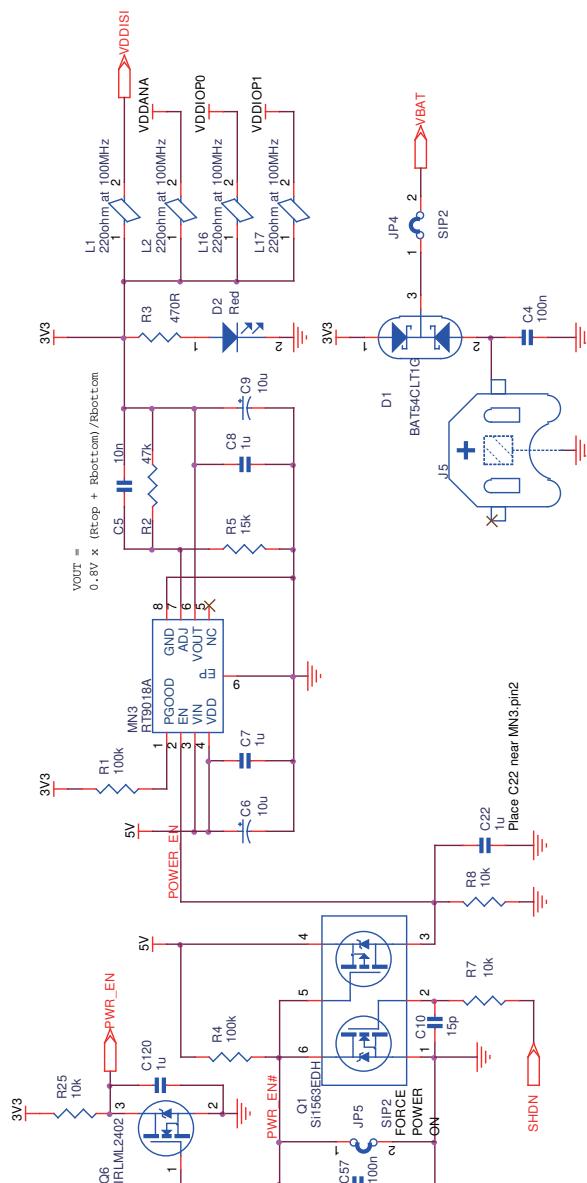

The EK Board features one adjustable LDO. It accepts DC 5V power input and outputs a regulated +3.3V to most other circuits on the board through four 3.3V rails.

- VDDPIO0
- VDDPIO1
- VDDANA
- VDDISI

This LDO is enabled through a dual FET scheme. The processor can assert SHDN (which is a VDDBU-powered I/O) to shut down the LDO to enter the so-called backup mode. The regulator on CM board is also shut down by the action of the SHDN signal.

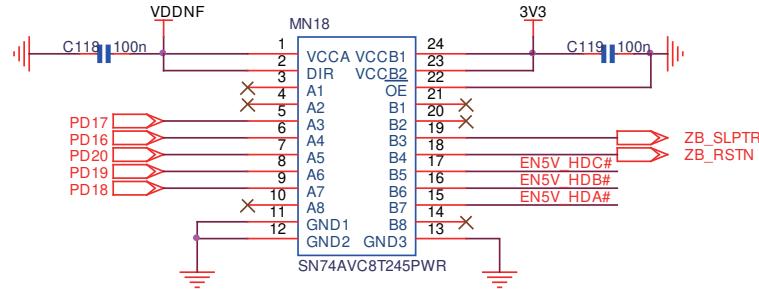

If the 3V battery is mounted on J5, both CM and EK boards can be woken up by action on the BP2 button, which drives the WKUP signal (also a VDDBU-powered I/O).

Figure 3-19. EK Board Power Management

There is another 3.3V rail, VDDNF, supplied from the CM board. VDDNF is set to 3.3V in the current CM design. The processors also support a 1.8V NAND Flash device, in which case VDDNF is set to 1.8V. In order to avoid potential voltage conflict on user-defined applications, a level shifter is inserted between the PIO lines on VDDNF rail and the 3.3V application.

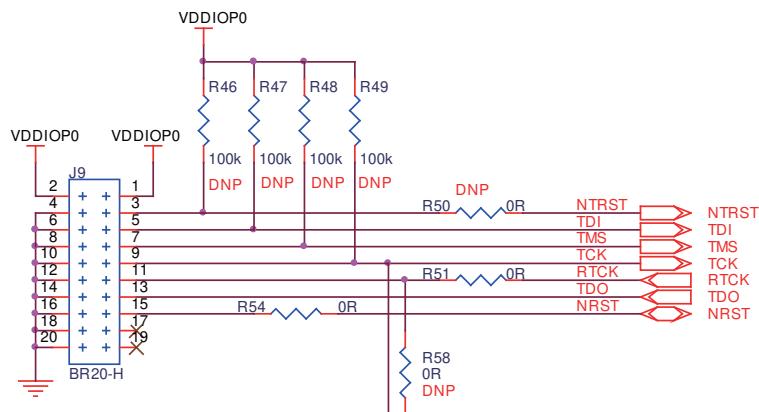

Figure 3-20. Level Shifter For VDDNF Rail

3.3.3.3 JTAG/ICE

Software debug is accessed by a standard 20-pin JTAG connection. This allows connection to a standard USB-to-JTAG in-circuit emulator such as SAM-ICE™.

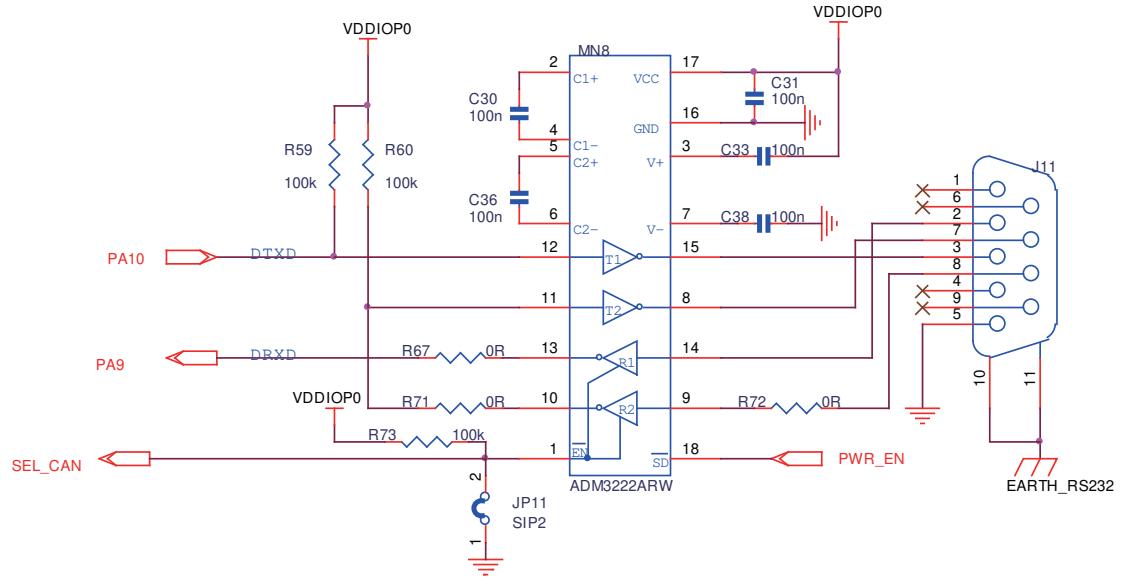

Figure 3-21. JTAG Interface

3.3.3.4 DBGU

The UART is connected to the DB-9 male socket through an RS-232 Transceiver (TXD and RXD only). A jumper, JP11, is used to select DBGU or CAN0 between IO (PA9, PA10) sharing scheme. Close JP11 to select DBGU.

Figure 3-22. DBGU Com Port

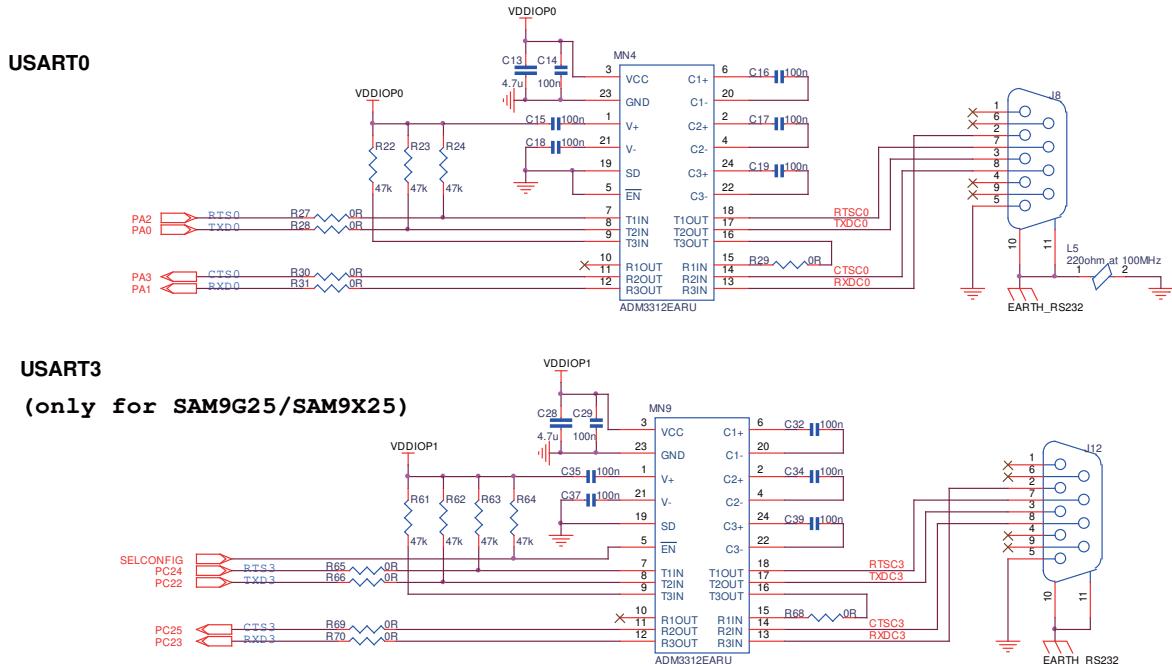

3.3.3.5 USART

The USART0 and USART3 are used as serial communication ports. Both USARTs are buffered with an RS-232 Transceiver (TXD, RXD and handshake CTS/RTS control) and connected to the DB-9 male socket. The software must assign the appropriate PIO pins to enable the USART function.

The USART3 is only supported by SAM9G25 and SAM9X25 processors. The RS-232 Transceiver for USART3 is enabled by the signal SELCONFIG comprised of a pull down resistor on CM board. Ref to [Section 3.4.1 "DM Board Overview"](#) for details.

Figure 3-23. USART Com Port

3.3.3.6 USB Ports

The Evaluation Kit features three USB communication ports:

- | | |
|--------|---|
| Port A | Host High Speed (EHCI) and Full Speed (OHCI) multiplexed with USB Device High speed Micro AB connector, J20 |
| Port B | Host High Speed (EHCI) and Full Speed (OHCI) standard type A connector, J19 upper port |
| Port C | Host Full speed OHCI only standard type A connector, J19 lower port |

All three USB Host ports are equipped with 500 mA high-side power switch for self-powered and bus-powered applications. The USB device port features VBUS insert detection function through the resistor ladder R138 and R139.

Refer to the embedded MPU product datasheet for detailed programming information. For datasheet reference numbers and titles, see “[Related Documents](#)” .

Figure 3-24. USB Port (A)

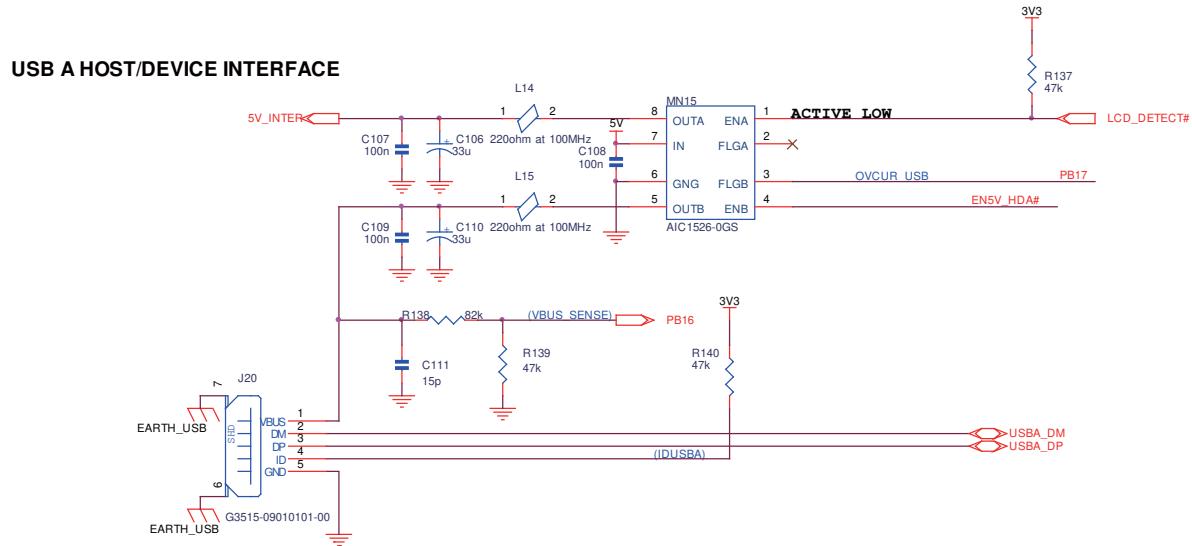

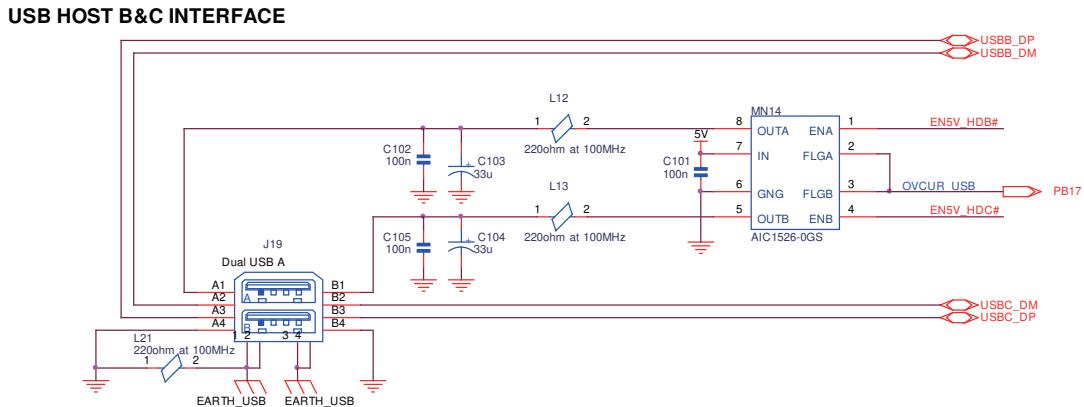

Figure 3-25. USB Port (B & C)

3.3.3.7 Ethernet 10/100 (EMAC) Port

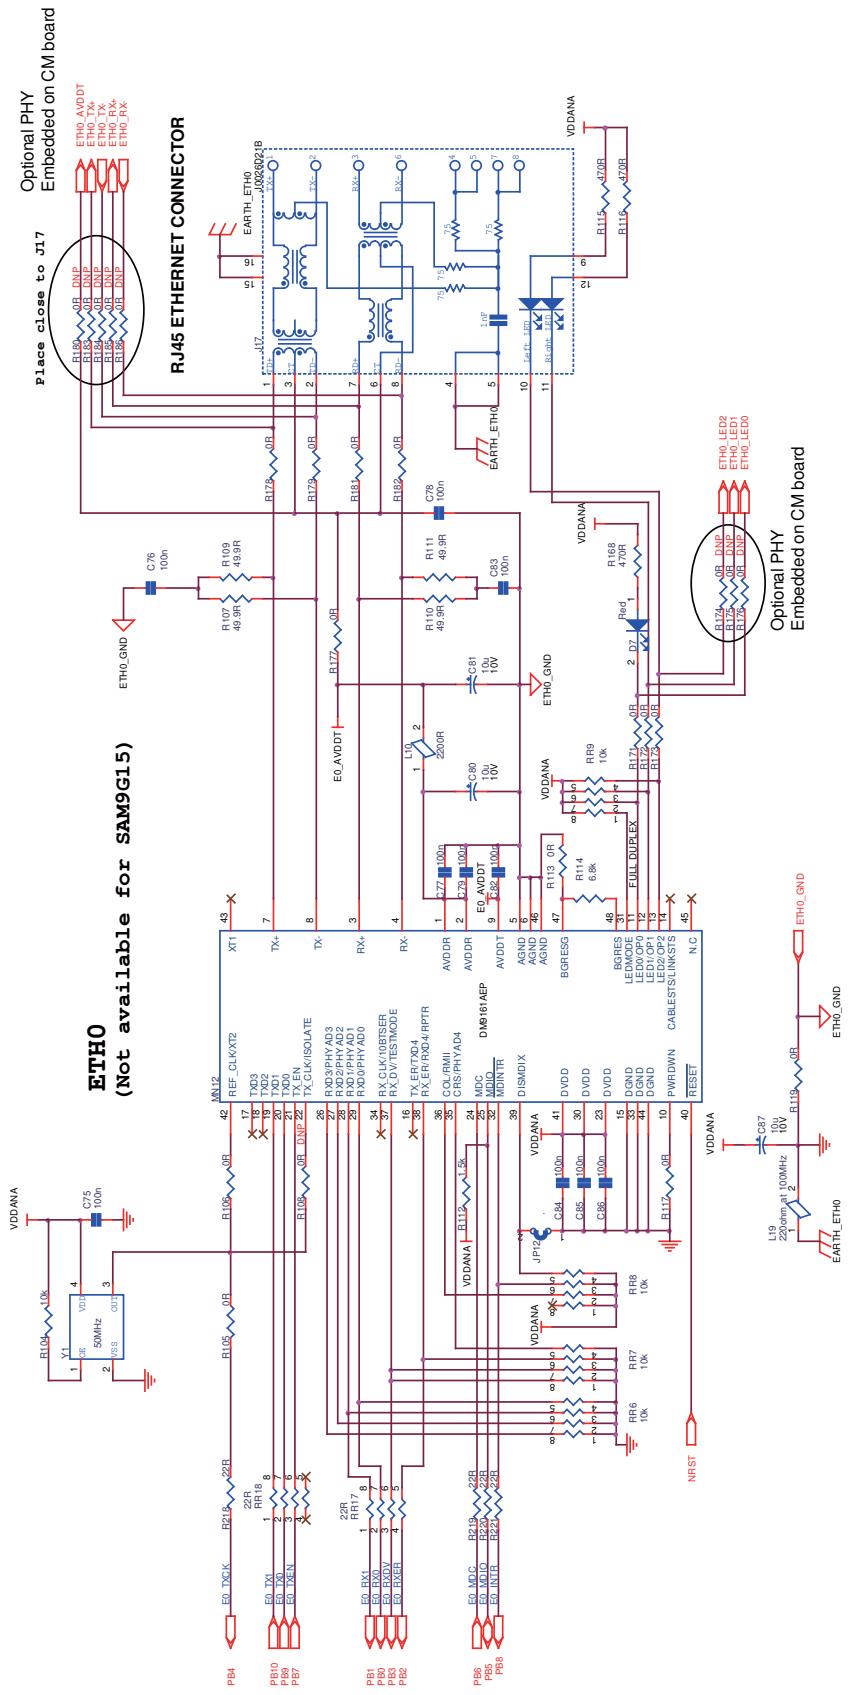

Except for SAM9G15, the processor has two 10/100 Mbps Ethernet Mac Controllers.

| | SAM9G15 | SAM9G35 | SAM9X35 | SAM9G25 | SAM9X25 |
|------|---------|---------|---------|---------|------------|
| EMAC | - | RMII | RMII | MII | MII + RMII |

The EK board is equipped with two Davicom DM9161AEP PHYs for each Ethernet port. Both PHY Transceivers are configured as RMII mode. Both PHY transceivers have an RJ45 port with embedded transformer and three-status LEDs.

By default, the ETH0 interface is implemented on the EK board. Additionally, for monitoring and control purposes, an LED functionality is carried on the RJ45 connectors to indicate activity, link, and speed status information for the respective ports.

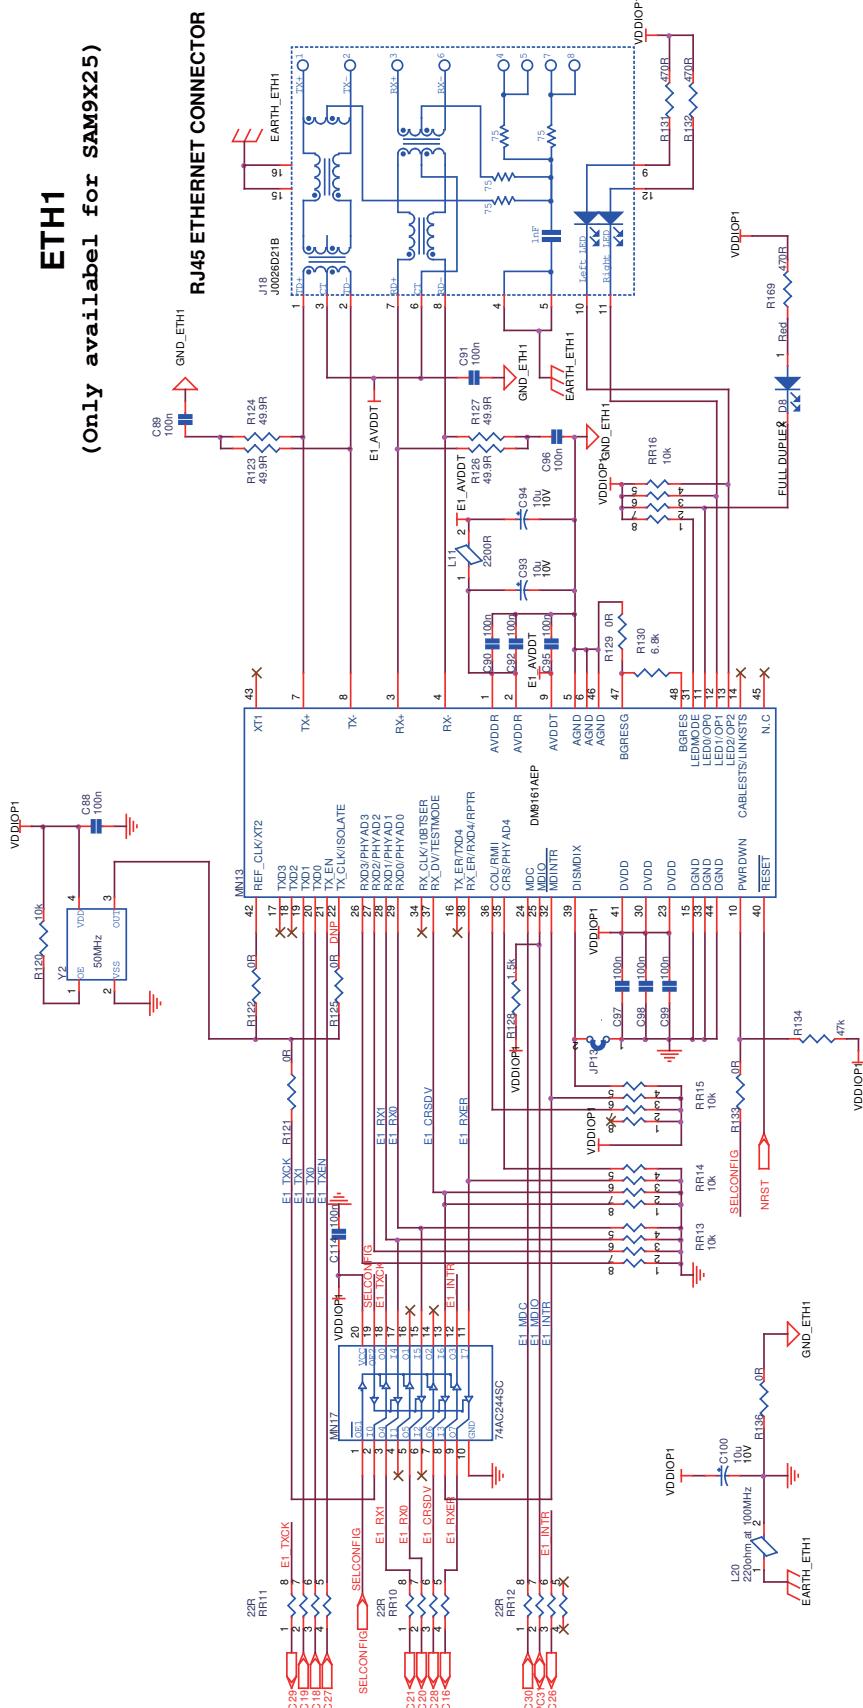

Figure 3-26. ETH0 Port

Ethernet 1 is only available for SAM9X25. The PHY on Ethernet 1 is enabled by the SELCONFIG signal from a pull-down resistor on the CM board. Refer to [Section 3.4.1 "DM Board Overview"](#) for detail.

Some pins (PC16, PC20, PC21, PC28, PC26 and PC29) are configured as Ethernet 1 input from PHY for SAM9X25, whereas they are configured as LCD data pins on other processors. An IO buffer MN17 is inserted in series with these signals to prevent the LCD from being disturbed by unknown status of the PHY device.

Figure 3-27. ETH1 Port

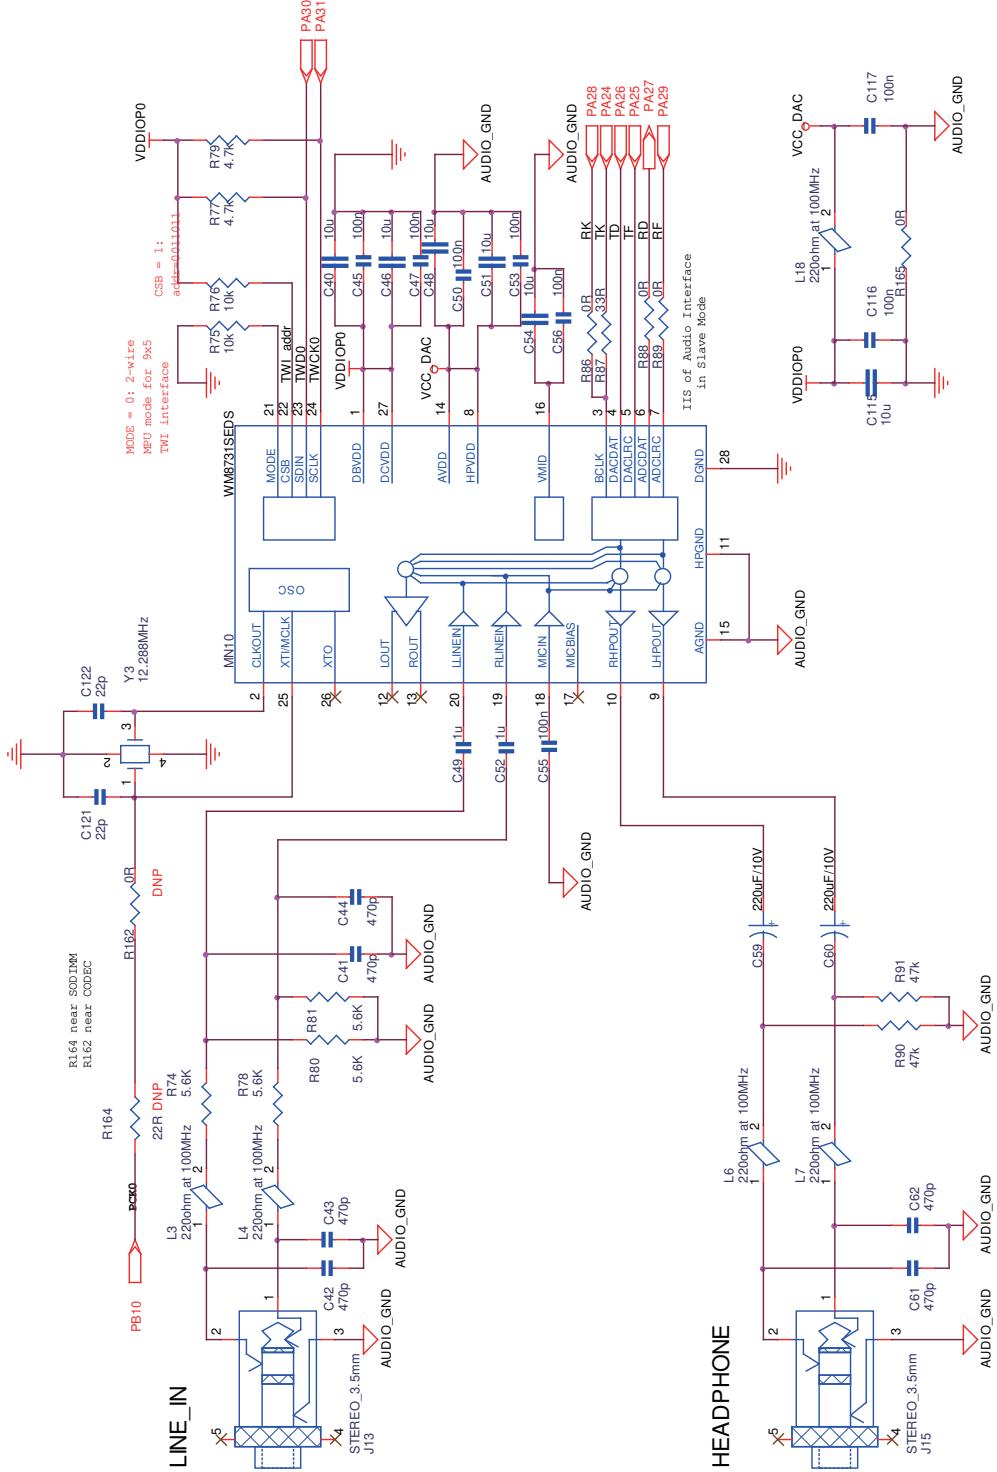

3.3.3.8

Audio

The Evaluation Kit includes a WM8731 CODEC for digital sound input and output. This interface includes audio jacks for line audio input (J13) and headphone line output (J15).

The SAM9 processor is configured in IIS slave mode to interface with the WM8731 Codec. The IIS master mode is also possible for evaluation by populating R162/R164 and removing the crystal Y3.

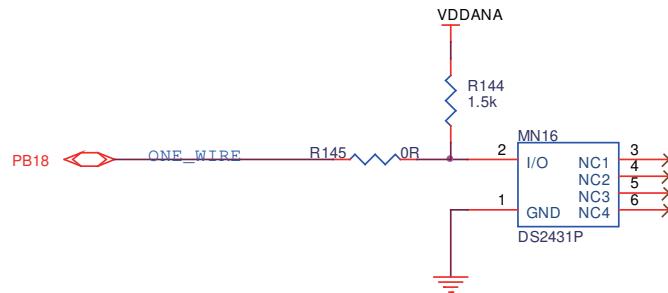

Figure 3-28. Audio Interface

3.3.3.9 1-Wire EEPROM

The EK board also features a 1-Wire device acting as a “firmware label” to store information like chip type, manufacturer’s name, production date etc.

Figure 3-29. 1-Wire on EK

3.3.3.10 CAN Bus

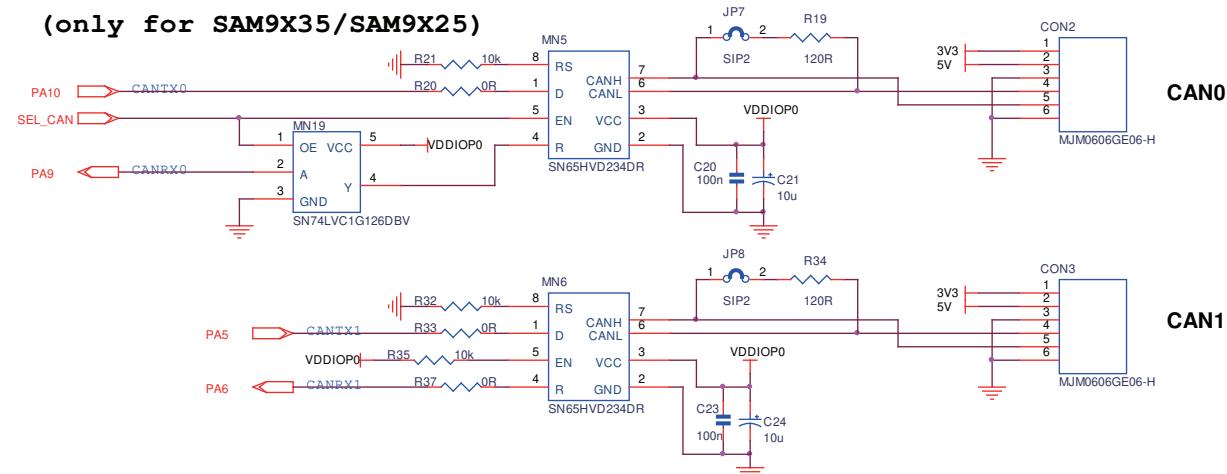

Two boards, the SAM9X35-EK and SAM9X25-EK, feature two Controller Area Network (CAN) ports with transceiver.

CAN0 uses the same IOs (PA9, PA10) as the DBGU. A jumper, JP11, is used to select either of the interfaces.

- Open JP11 to select the CAN function.
- Close JP11 to select the DBGU function.

A 3-state output buffer, MN19 is inserted in series with the output channels of the CAN transceiver, which share IOs with the DBGU. This is necessary because the CAN transceiver does not feature 3-state outputs.

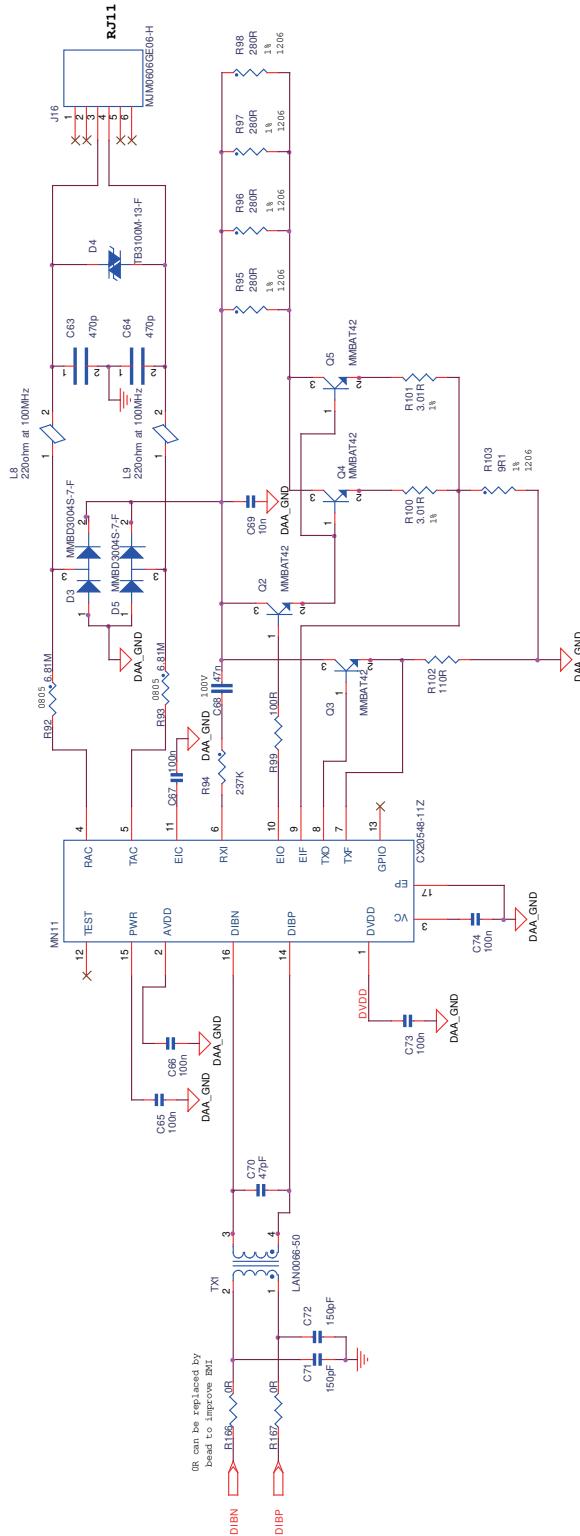

Figure 3-30. CAN on EK

3.3.3.11 Telephone Interface

The Evaluation Kit features a smart DAA (Data Access Arrangement) chip to drive an analog telephone line on RJ11 6P4C port (J16).

Figure 3-31. Telephone Interface

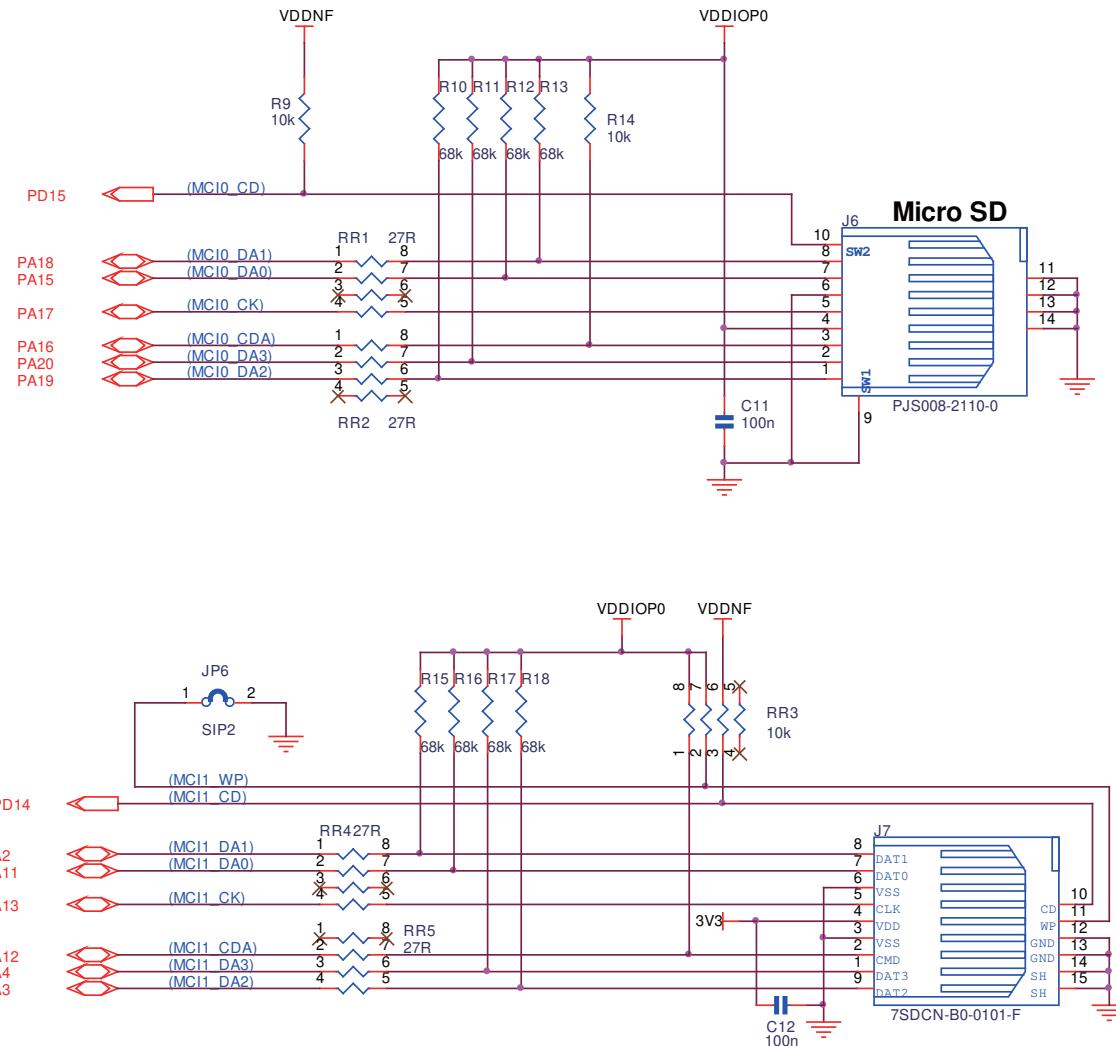

3.3.3.12 SD/MMC Interface

The EK board has two high-speed MultiMedia Card Interfaces (MCI). The first interface is used as a 4-bit interface (MCI0), connected to a MicroSD card slot. The second interface is used as a 4-bit interface (MCI1), connected to an SD/MMC card slot.

The memory card is not included in the Evaluation Kit.

Please note that the power is connected to VCC, which is 3.3 volts.

Figure 3-32. SD/MMC Interface

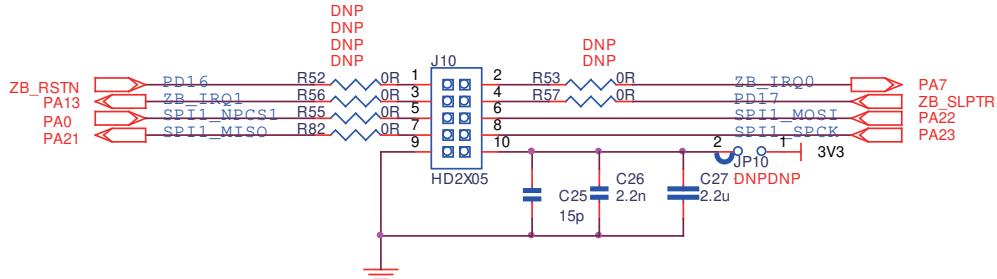

3.3.3.13 ZigBee

The EK board has a 10-pin male connector for the Atmel RZ600 ZigBee module.

DNP 0 Ohm resistors have been implemented in series with the PIO lines that are used elsewhere in the design. Thereby, enable their individual disconnections, should a conflict occur in user application.

Figure 3-33. ZigBee Interface

3.3.3.14 LED Indicators

The EK board has three LED indicators for purposes shown below:

Table 3-8. LED Indicators

| Reference | Color | Function |
|-----------|-------|---------------------|
| D2 | Red | 3v3 Power indicator |
| D7 | Red | ETH0 Full Duplex |
| D8 | Red | ETH1 Full Duplex |

Refer to [Section 3.3.3.2 "Power Supplies"](#) and [Section 3.3.3.7 "Ethernet 10/100 \(EMAC\) Port"](#) for details.

3.3.3.15 Expansion Ports

Most GPIOs are routed to expansion ports J1, J2, J3.

All I/Os of the MPU Image Sensor Interface (ISI) are routed to connectors J21.

The LCD and touch screen interfaces are routed to connectors J21, J22.

Figure 3-34. I/O Expansion

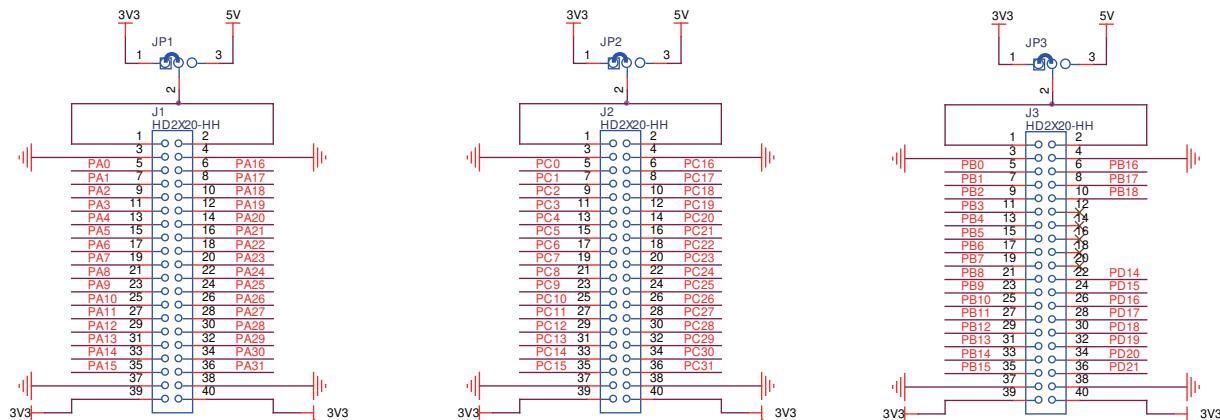

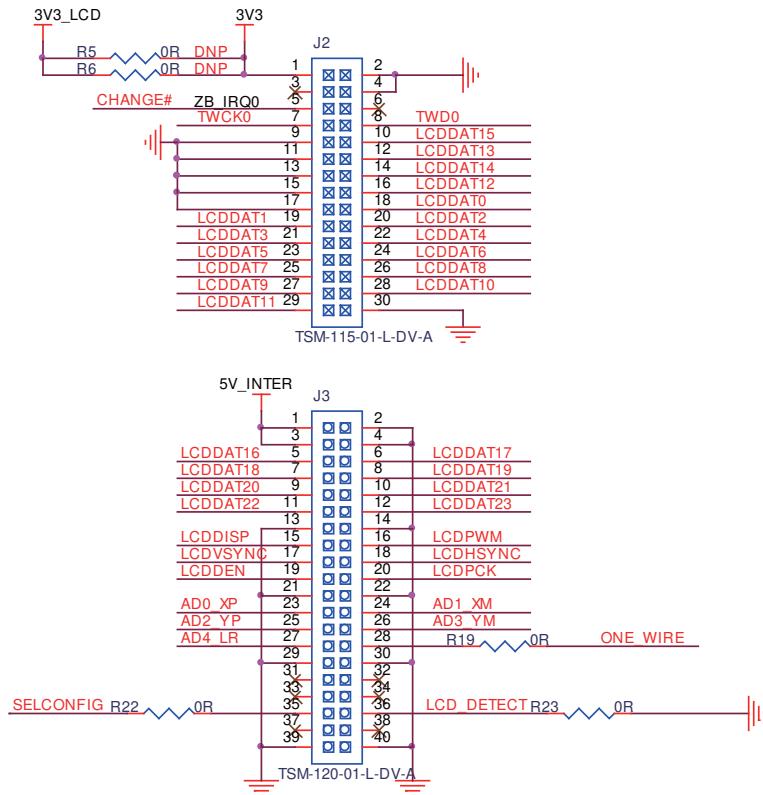

Figure 3-35. LCD and ISI Expansion

3.3.4 Configuration

This section describes the PIO usage, the jumpers, the test points and the solder drops of the EK board.

3.3.4.1 JTAG/ICE Configuration

Table 3-9. JTAG/ICE

| Designation | Default Setting | Feature |
|-------------|-----------------|---|
| R50 | Not Populated | Disables the ICE NTRST input |
| R51 | Populated | Enables the ICE RTCK return. R94 must be opened |
| R54 | Populated | Enables the ICE NRST input |
| R58 | Not Populated | Disables TCK <-> RTCK local loop |

3.3.4.2 Boot Mode Select Configuration

Table 3-10. BMS

| Designation | Default Setting | Feature |
|-------------|-----------------|---|
| JP9 | Open | Default to boot on embedded ROM Close to boot on external memory |

3.3.4.3

Force Power ON Configuration

Table 3-11. Force Power ON

| Designation | Default Setting | Feature |
|-------------|-----------------|--|
| JP5 | Close | Keep on-board regulator always on Open to feature SHDN function |

3.3.4.4

Write Protection Configuration on MCI1

Table 3-12. Write Protection on MCI1

| Designation | Default Setting | Feature |
|-------------|-----------------|---|
| JP6 | Close | MCI1 write protect selected Open to disable protection |

3.3.4.5

Selection between DBGU and CAN

Table 3-13. Select DBGU or CAN

| Designation | Default Setting | Feature |
|-------------|-----------------|---|
| JP11 | Close | Default to select DBGU Open to select CAN0 |

3.3.4.6

Codec IIS Configuration

Table 3-14. Codec IIS

| Designation | Default Setting | Feature |
|----------------|-----------------|--|
| R162, R164 | Not Populated | IIS master mode, clock the codec by PCK0 |
| C121, C122, Y3 | Populated | IIS slaver mode, clock the codec by external crystal |

3.3.4.7

ETH0 Configuration

Table 3-15. ETH0

| Designation | Default Setting | Feature |
|--|-----------------|---|
| R180, R183, R184, R185, R185, R186, R174, R175, R176 | Not Populated | Populated to select the PHY channel on CM. Channel on EK must be cut if select the PHY on CM. |
| R177, R178, R179, R181, R182, R218, R171, R172, R173 | Populated | Selection of PHY channel on EK |

| 2 | - | GND |
| 3 | - | Floating |

3.3.5.2 SODIMM Card Edge Socket

The Evaluation Kit uses a SODIMM200 standard connector for CM board interfacing.

Please note that this is not an industry standard pin-out and that it is unlikely to be compatible with off-the-shelf SODIMM cards.

Figure 3-37. SODIMM200 Socket CON1

3.3.5.3

JTAG/ICE Connector

Figure 3-38. JTAG J9

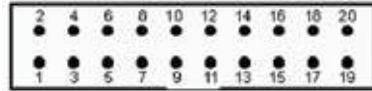

Table 3-22. JTAG/ICE Connector J13 Signal Descriptions

| Pin | Mnemonic | Description |
|-----|--|---|
| 1 | VTref. 3.3V power | This is the target reference voltage. It is used to check if the target has power, to create the logic-level reference for the input comparators, and to control the output logic levels to the target. It is normally fed from VDD on the target board and must not have a series resistor. |
| 2 | Vsupply. 3.3V power | This pin is not connected in SAM-ICE. It is reserved for compatibility with other equipment. Connect to VDD or leave open in target system. |
| 3 | nTRST TARGET RESET - Active-low output signal that resets the target | JTAG Reset. Output from SAM-ICE to the Reset signal on the target JTAG port. Typically connected to nTRST on the target CPU. This pin is normally pulled HIGH on the target to avoid unintentional resets when there is no connection. |
| 4 | GND | Common ground |
| 5 | TDI TEST DATA INPUT - Serial data output line, sampled on the rising edge of the TCK signal. | JTAG data input of target CPU. It is recommended that this pin is pulled to a defined state on the target board. Typically connected to TDI on target CPU. |
| 6 | GND | Common ground |
| 7 | TMS TEST MODE SELECT | JTAG mode set input of target CPU. This pin should be pulled up on the target. Typically connected to TMS on target CPU. Output signal that sequences the target's JTAG state machine, sampled on the rising edge of the TCK signal. |
| 8 | GND | Common ground |
| 9 | TCK TEST CLOCK - Output timing signal, for synchronizing test logic and control register access. | JTAG clock signal to target CPU. It is recommended that this pin is pulled to a defined state on the target board. Typically connected to TCK on target CPU. |
| 10 | GND | Common ground |
| 11 | RTCK - Input Return test clock signal from the target. | Some targets must synchronize the JTAG inputs to internal clocks. To assist in meeting this requirement, a returned and retimed TCK can be used to dynamically control the TCK rate. SAM-ICE supports adaptive clocking which waits for TCK changes to be echoed correctly before making further changes. Connect to RTCK if available, otherwise to GND. |
| 12 | GND | Common ground |
| 13 | TDO JTAG TEST DATA OUTPUT - Serial data input from the target. | JTAG data output from target CPU. Typically connected to TDO on target CPU. |
| 14 | GND | Common ground |
| 15 | nSRST RESET | Active-low reset signal. Target CPU reset signal. |
| 16 | GND | Common ground |
| 17 | RFU | This pin is not connected in SAM-ICE. |

Table 3-22. JTAG/ICE Connector J13 Signal Descriptions (Continued)

| Pin | Mnemonic | Description |
|-----|----------|---------------------------------------|
| 18 | GND | Common ground |
| 19 | RFU | This pin is not connected in SAM-ICE. |

Detailed description

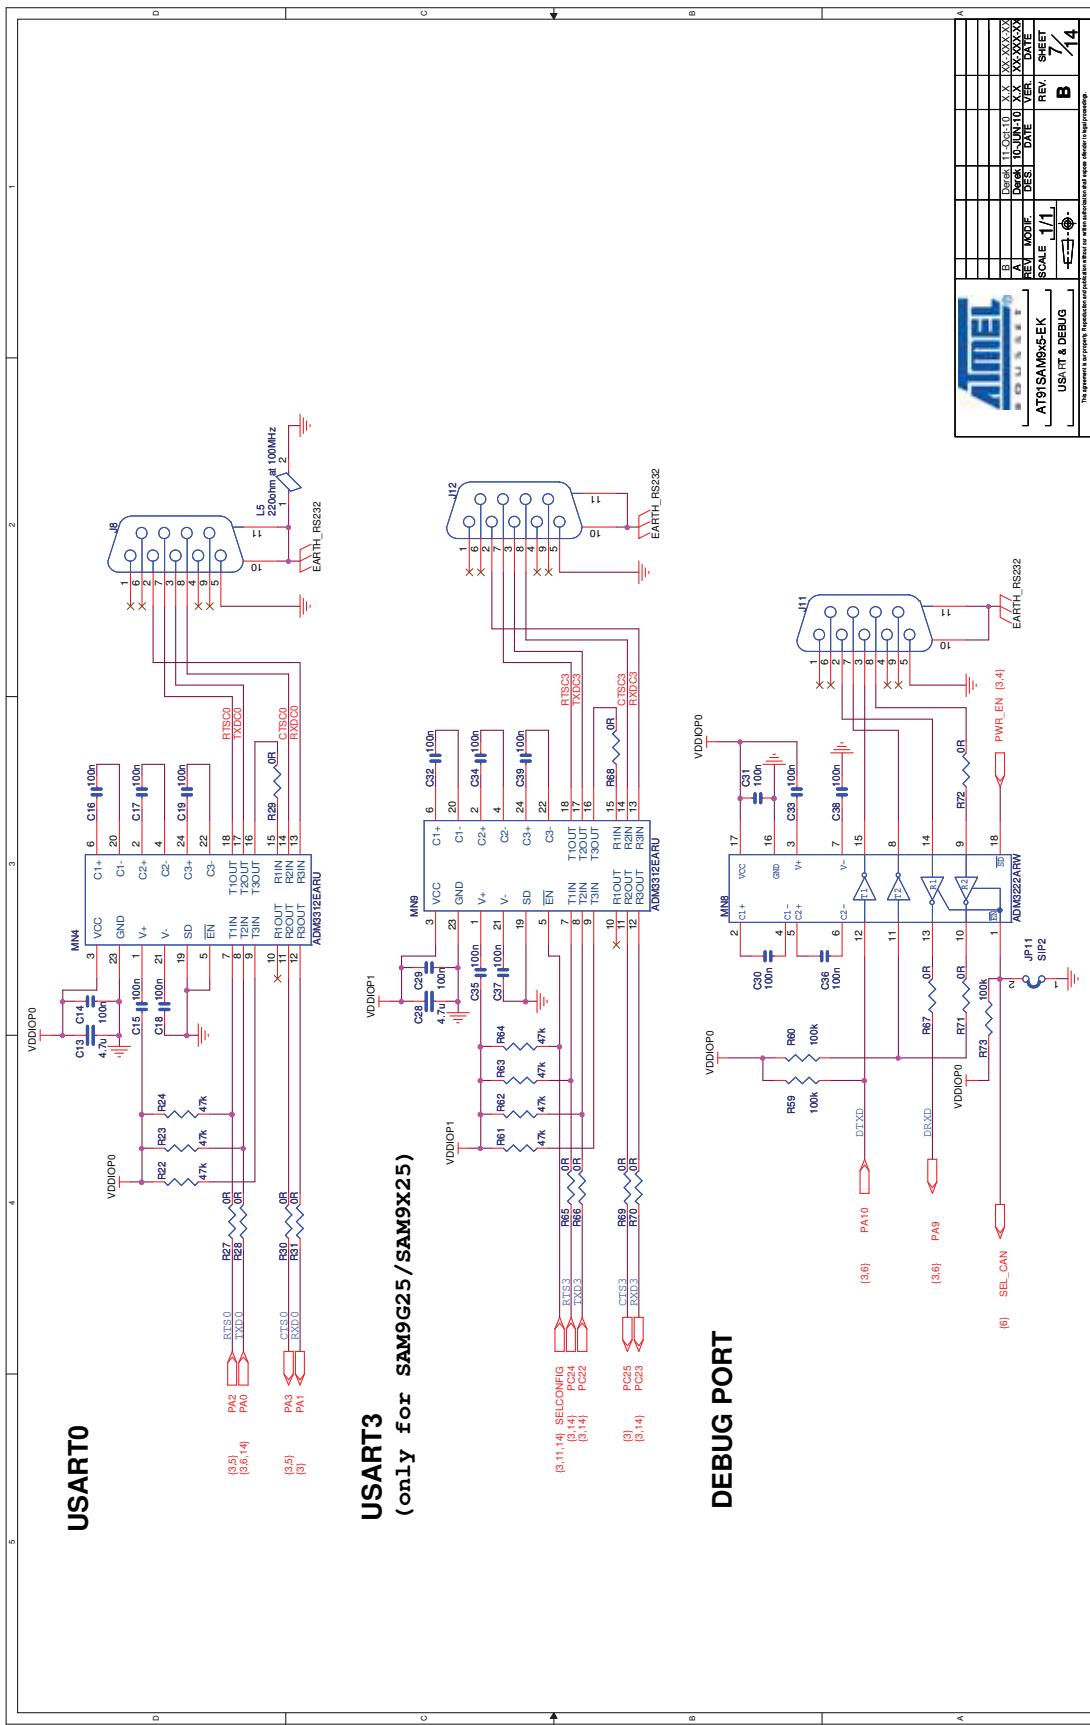

Page 14

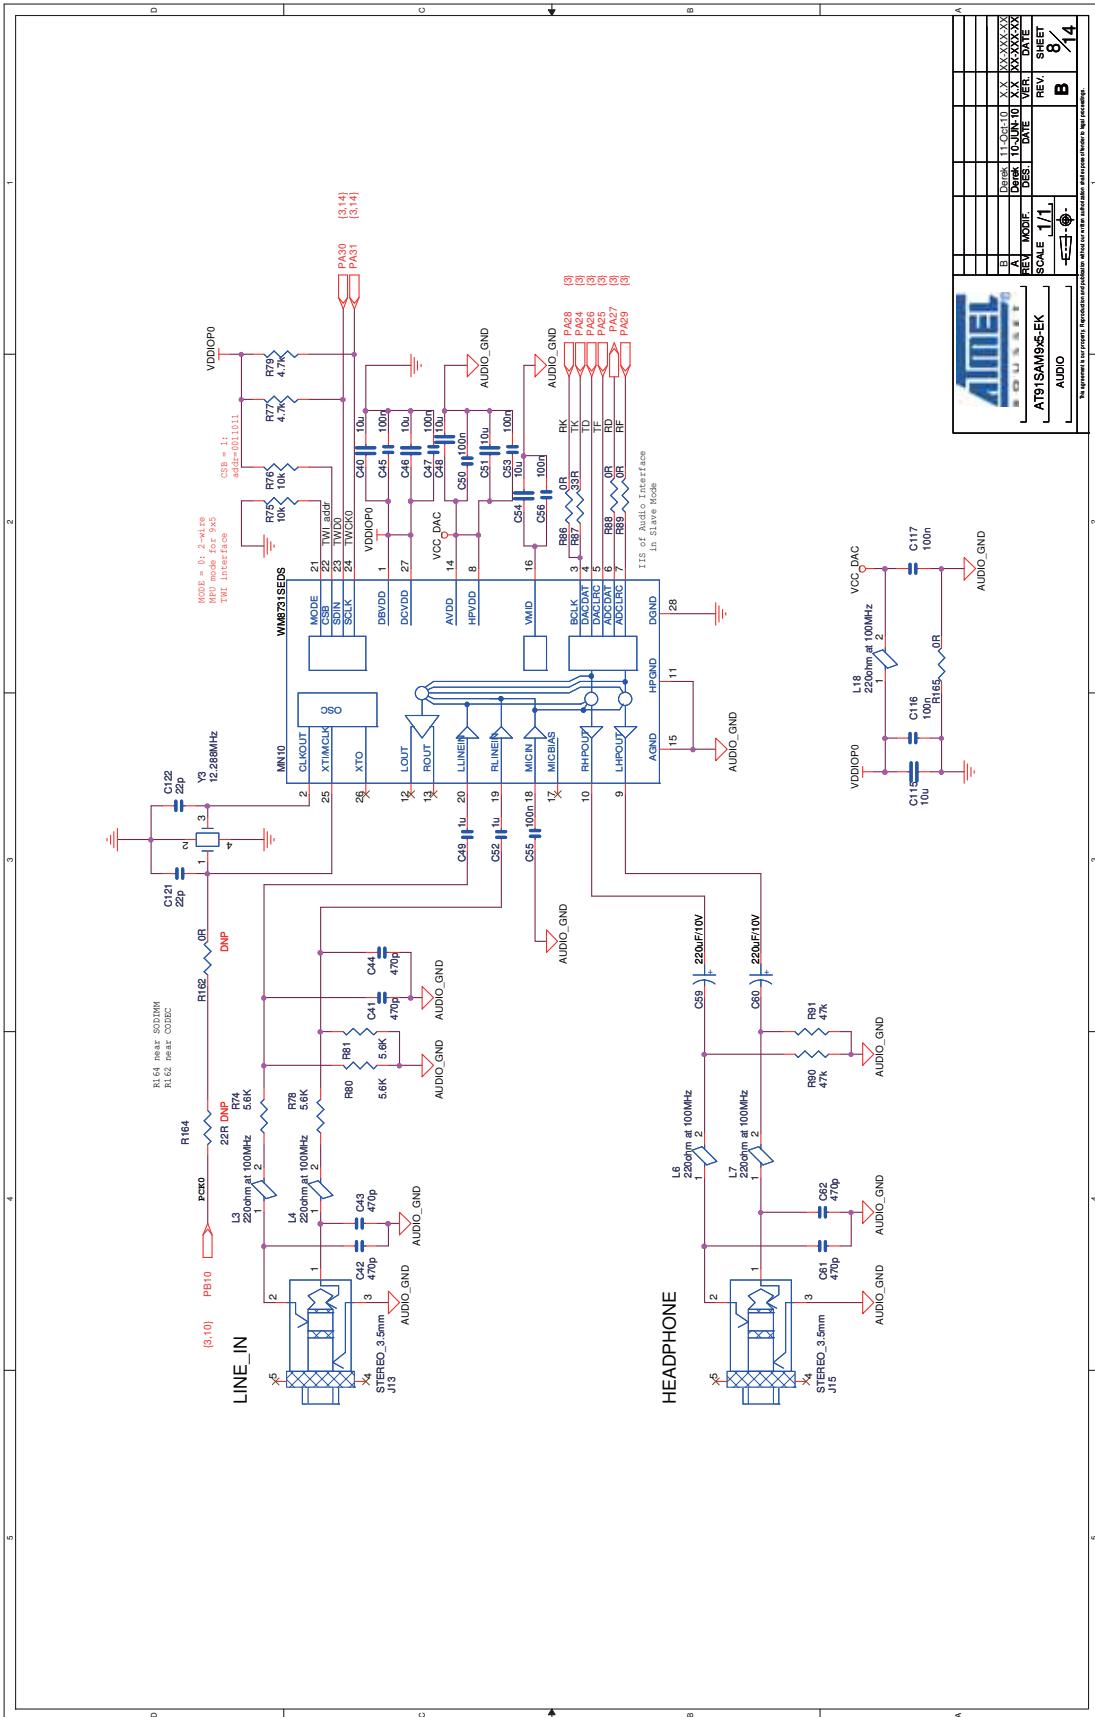

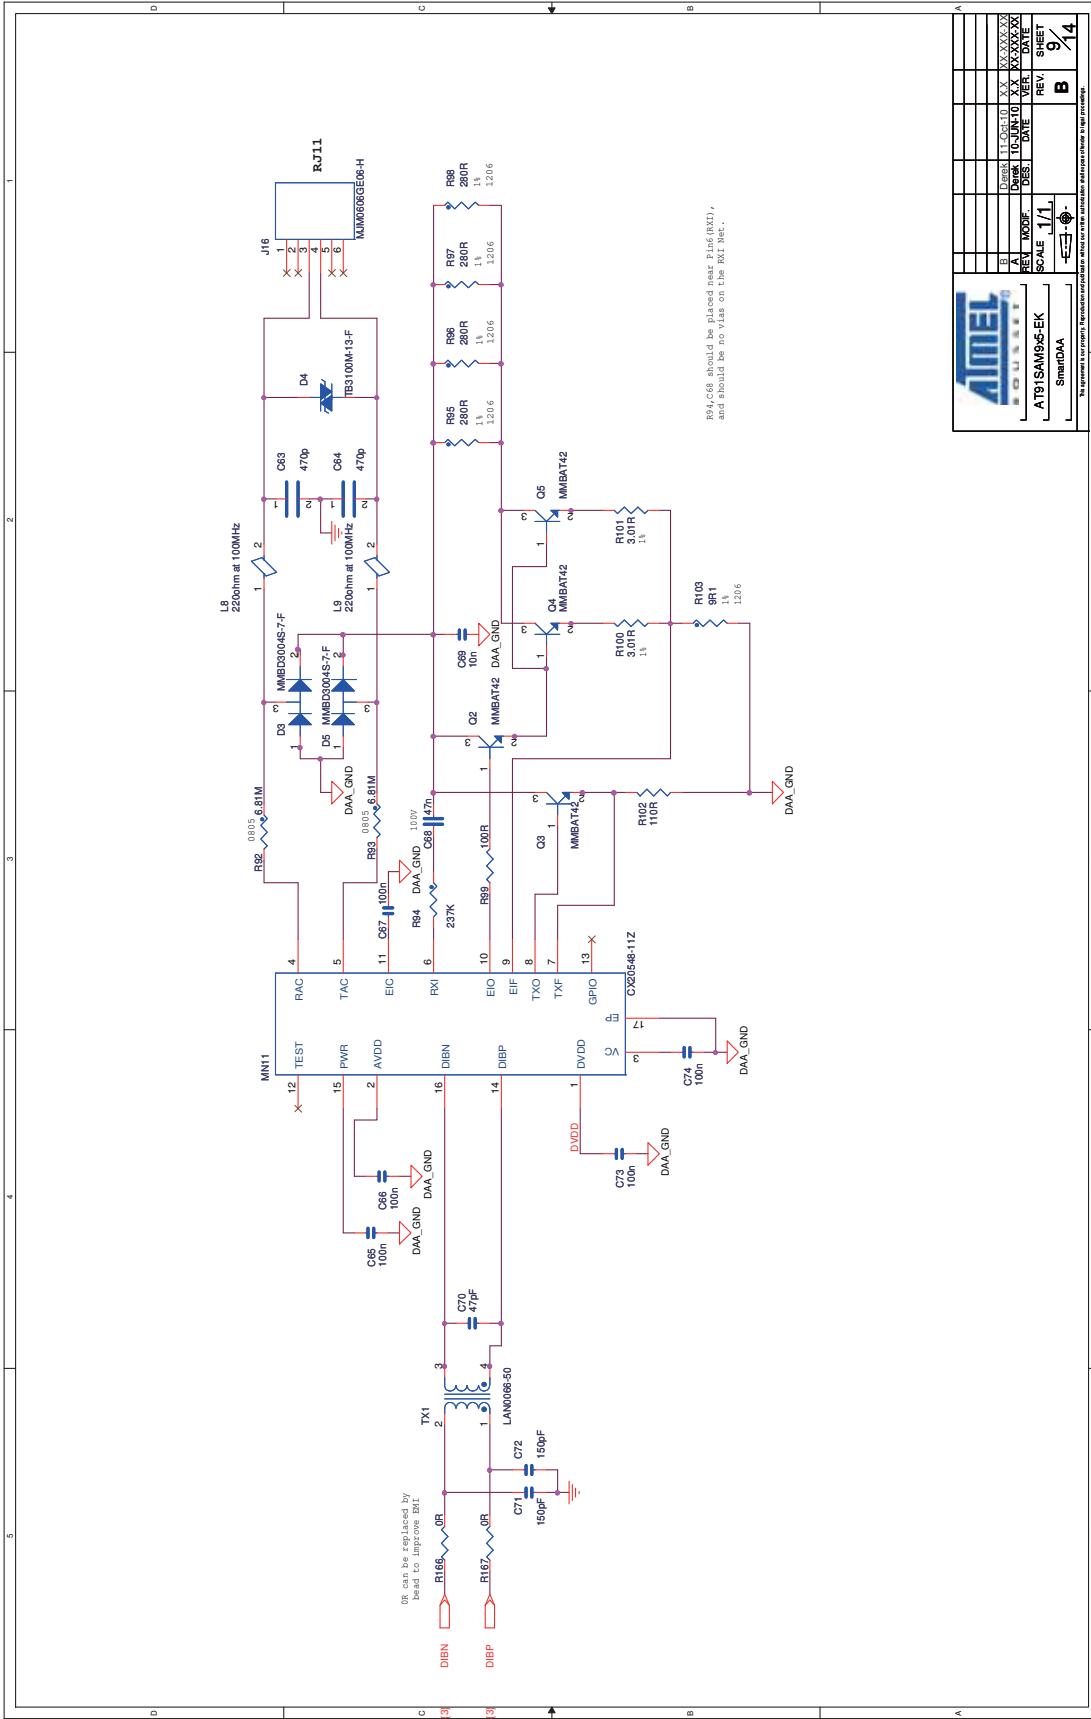

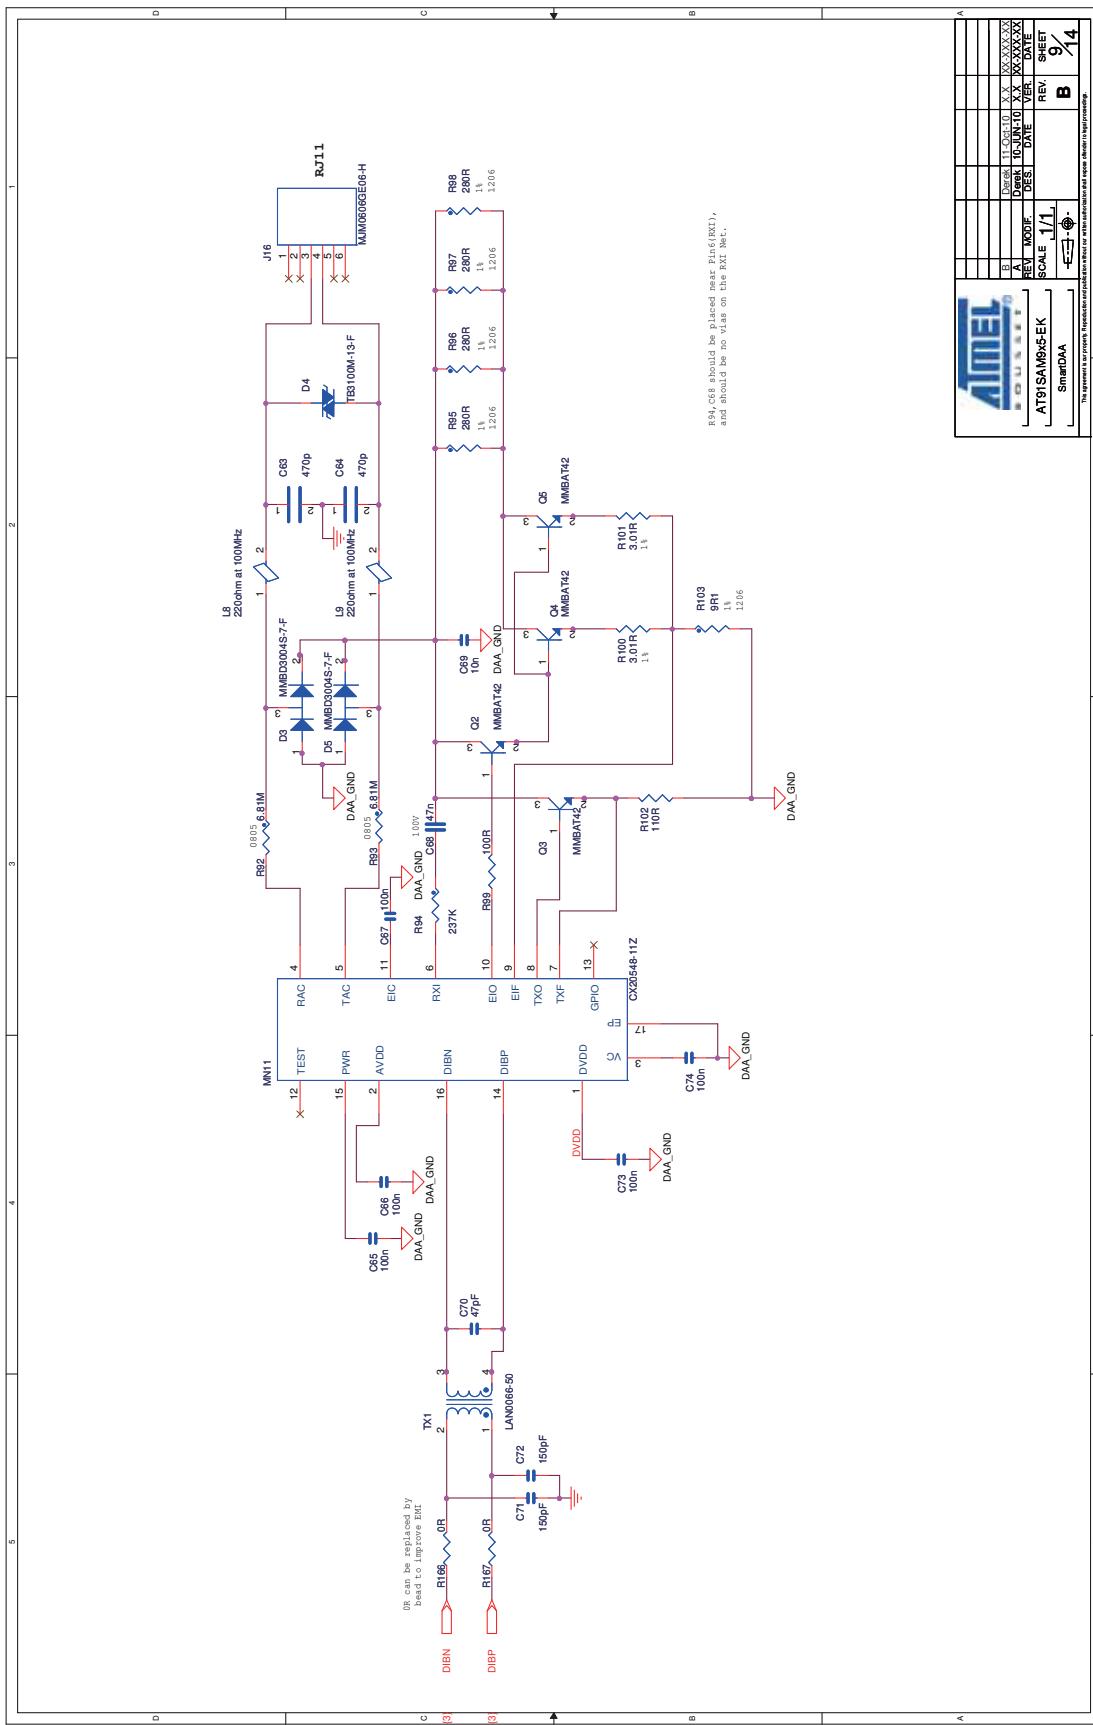

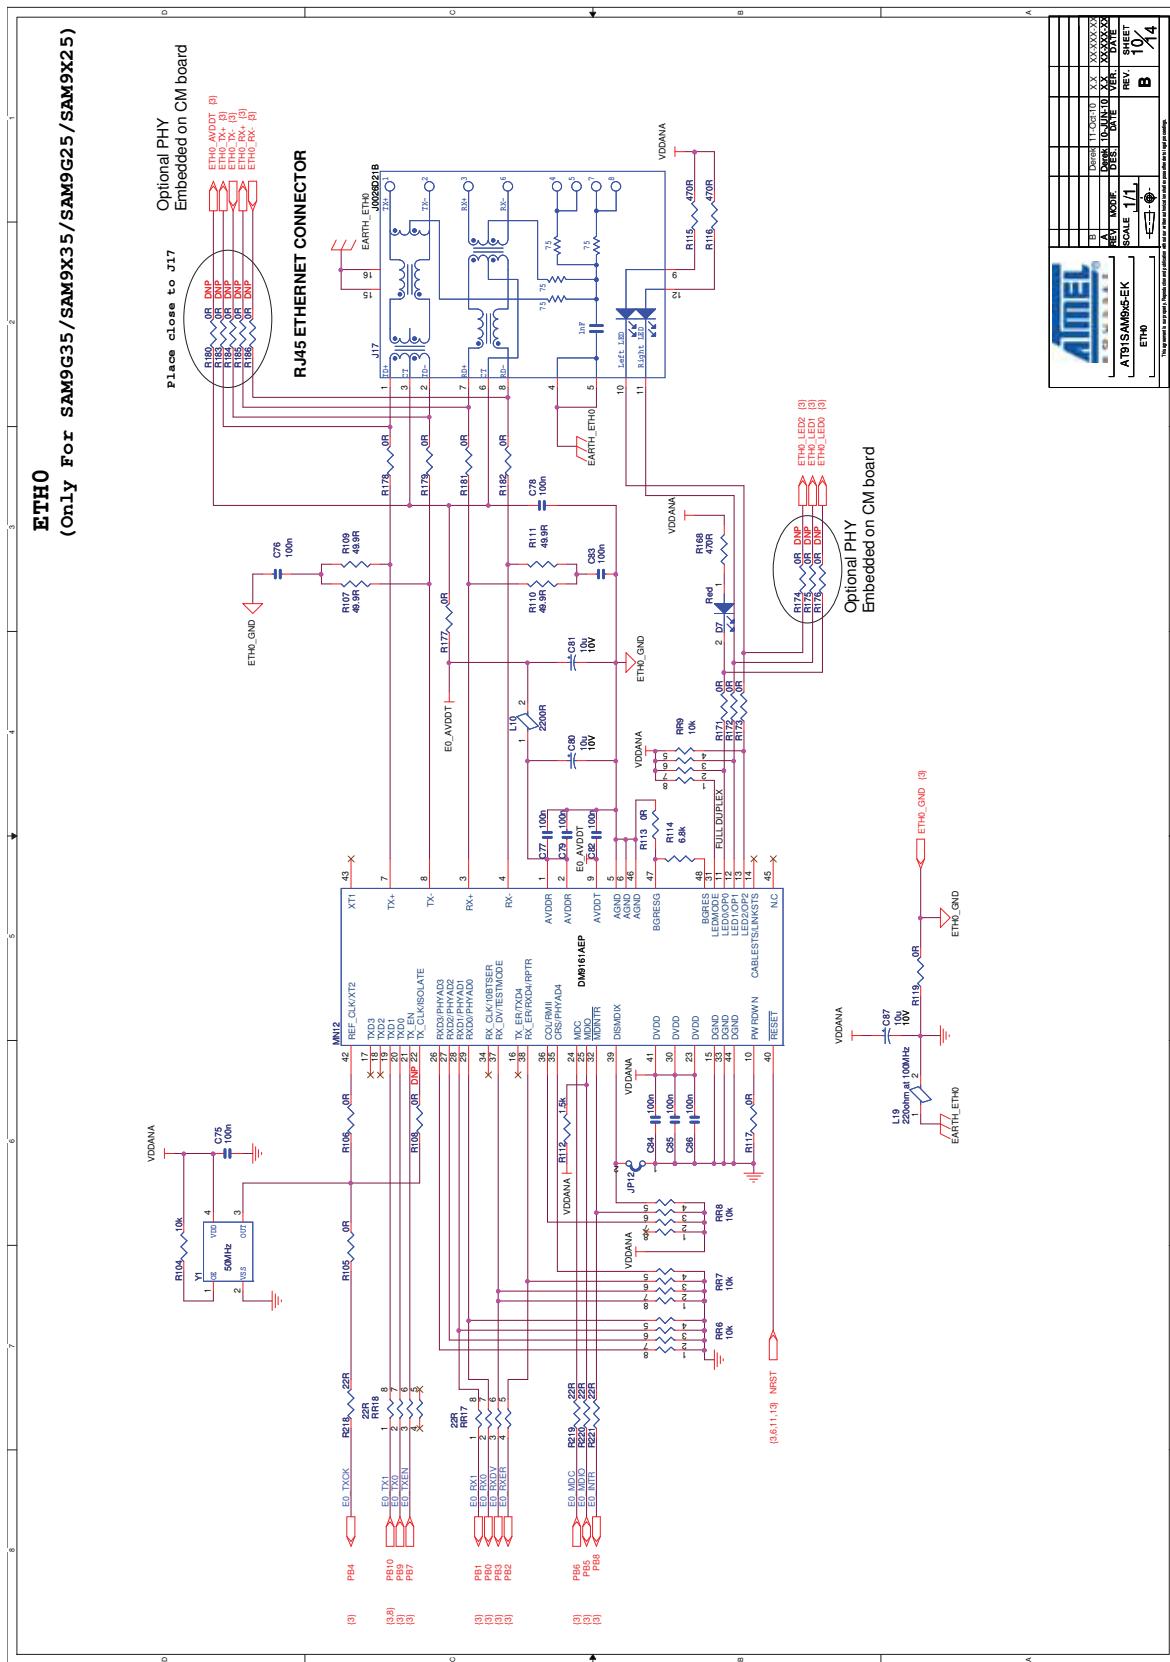

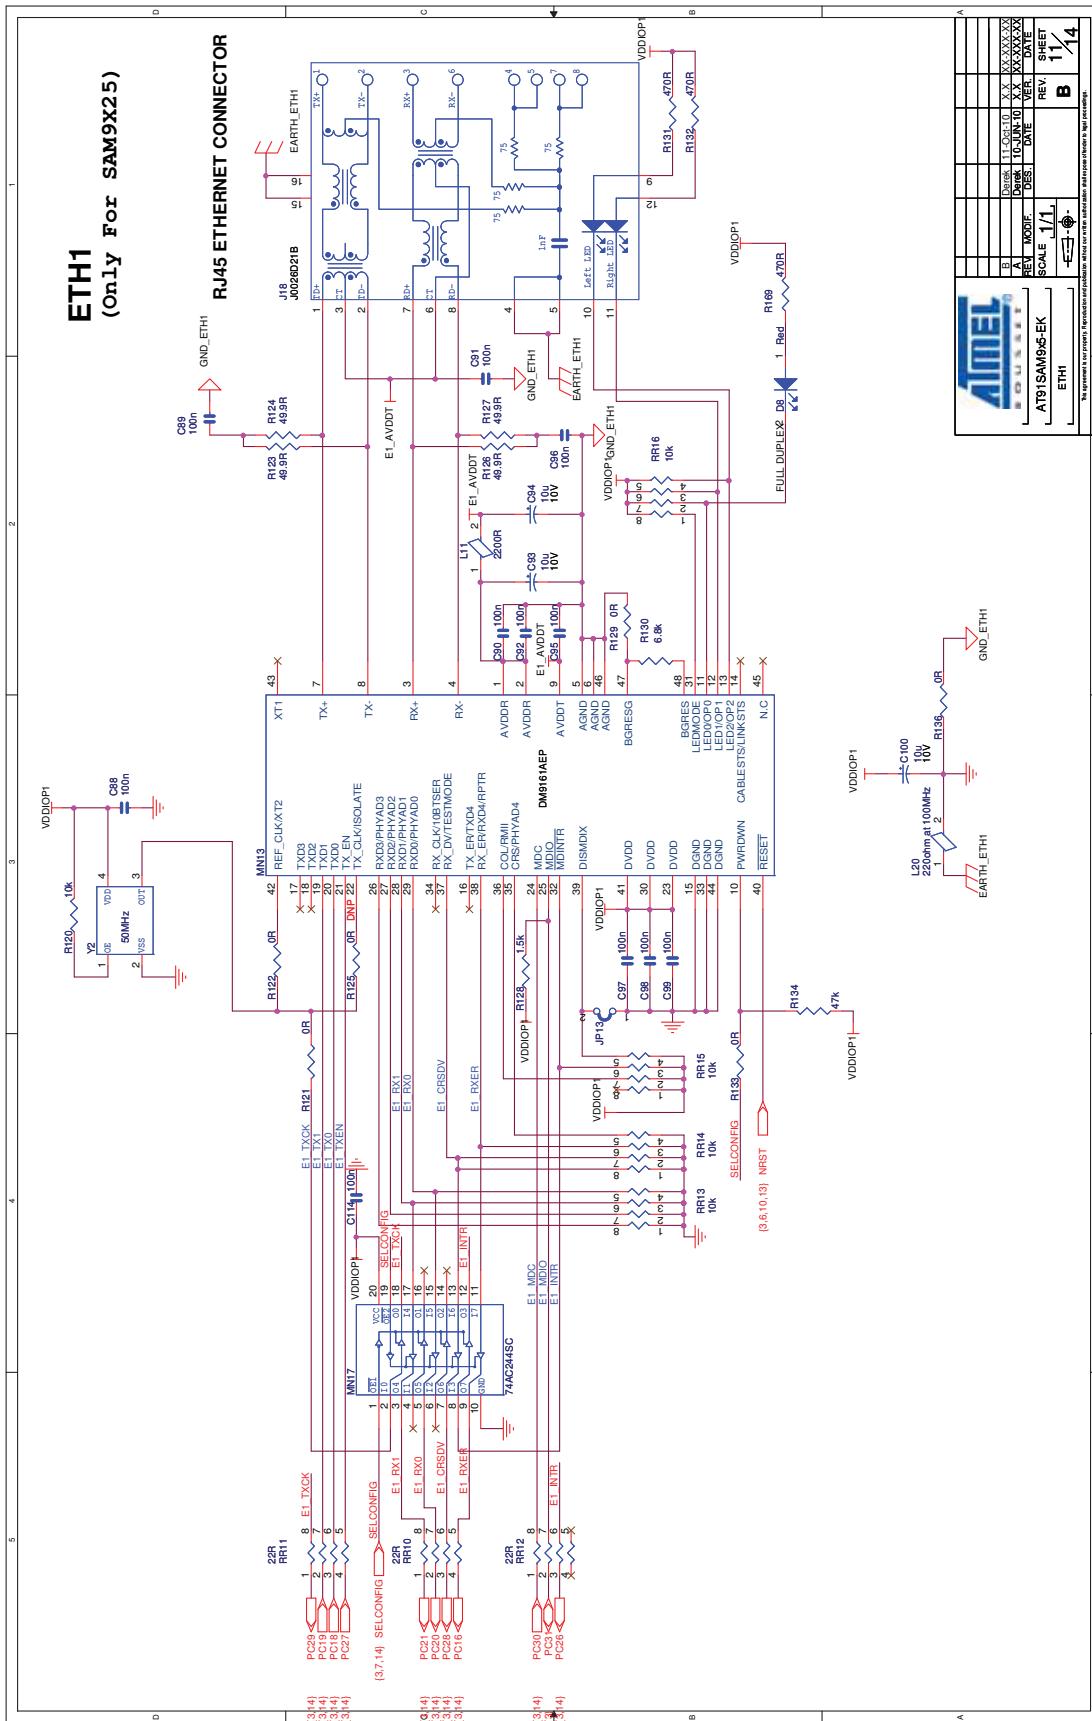

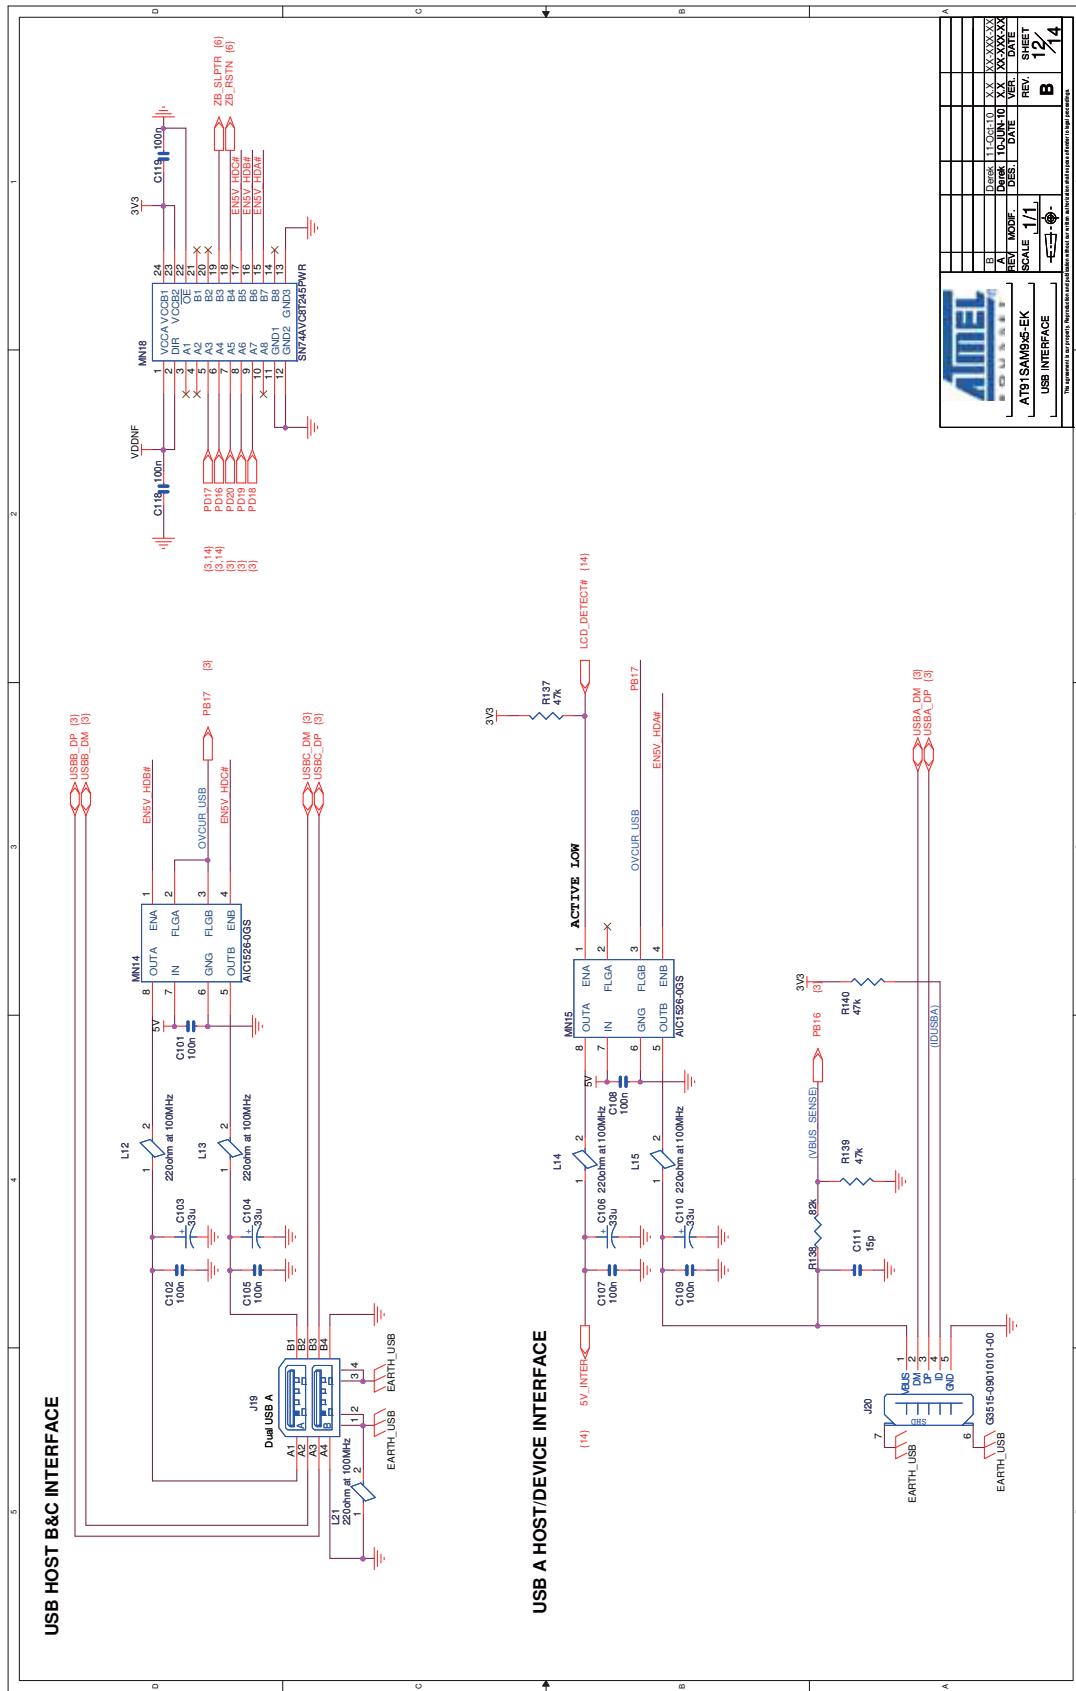

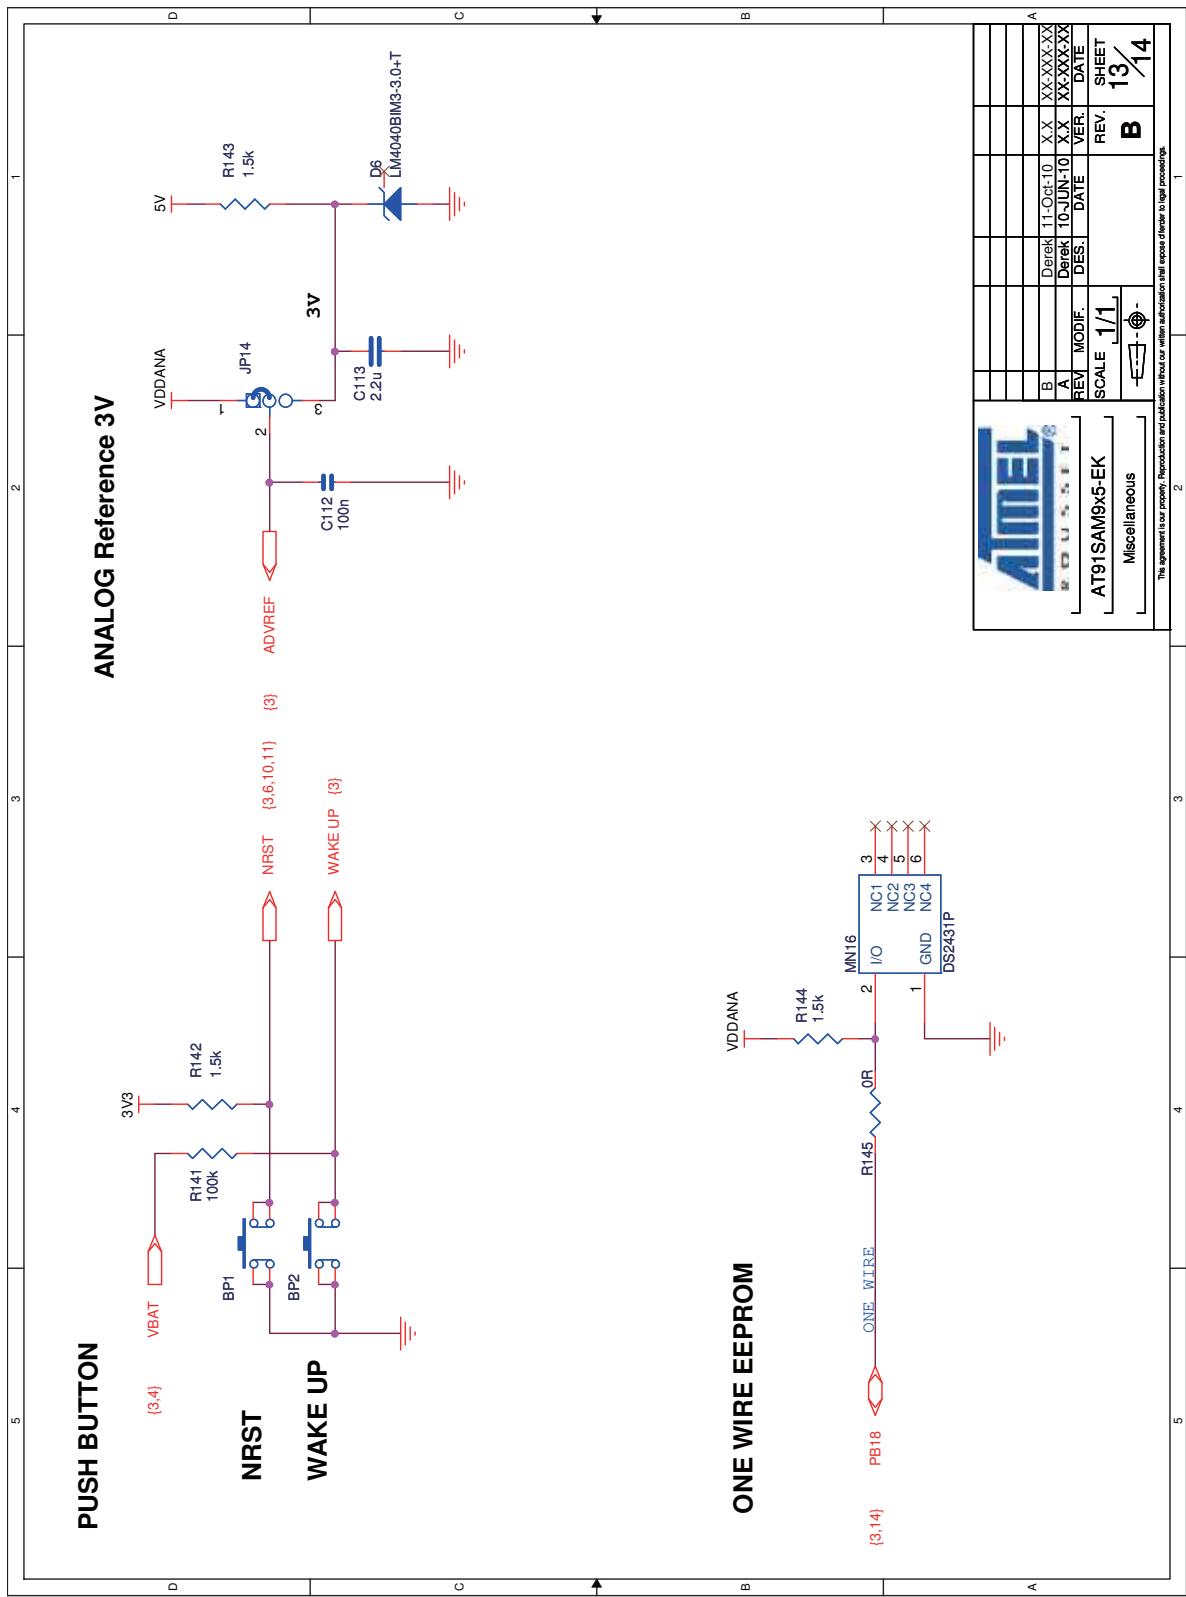

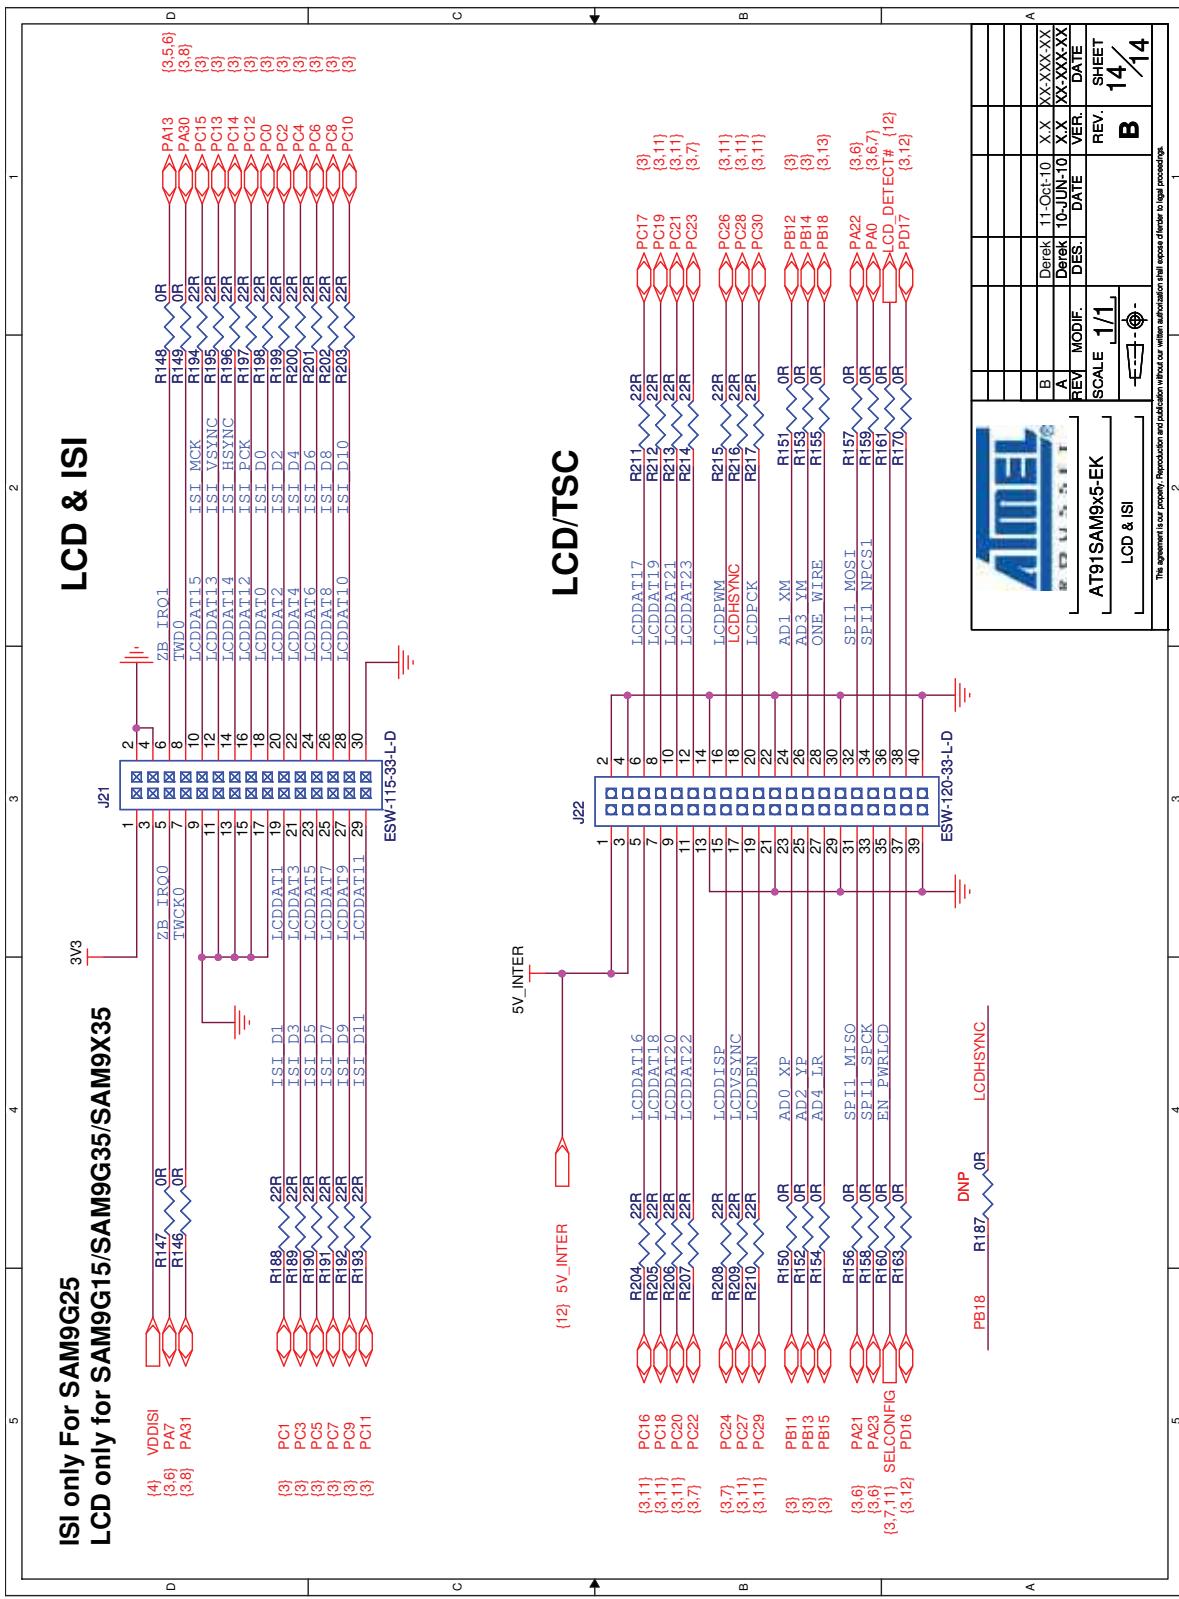

3.4 Optional Display Module (DM) Board Hardware

3.4.1 DM Board Overview

The optional DM board carries a 5.0" TFT LCD module with touch screen. The DM board also carries four QTouch pads.

Figure 3-55. DM Board Layout

3.4.2 Equipment List

The list of the DM board components follows:

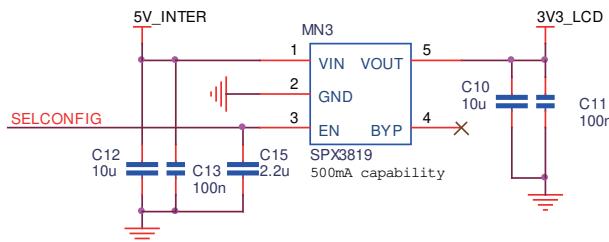

- One 5.0" TFT LCD module
- LCD Back light driver
- 3.3V regulator
- QTouch device
- 1-Wire device

3.4.3 Function Blocks

3.4.3.1 3.3V Regulator

The DM Board features its own LDO for local power regulation. It accepts DC 5V power from a 500 mA high-side power switch on the EK and outputs a regulated +3.3 V to most other circuits on the board.

Figure 3-56. DM Board Power Supply

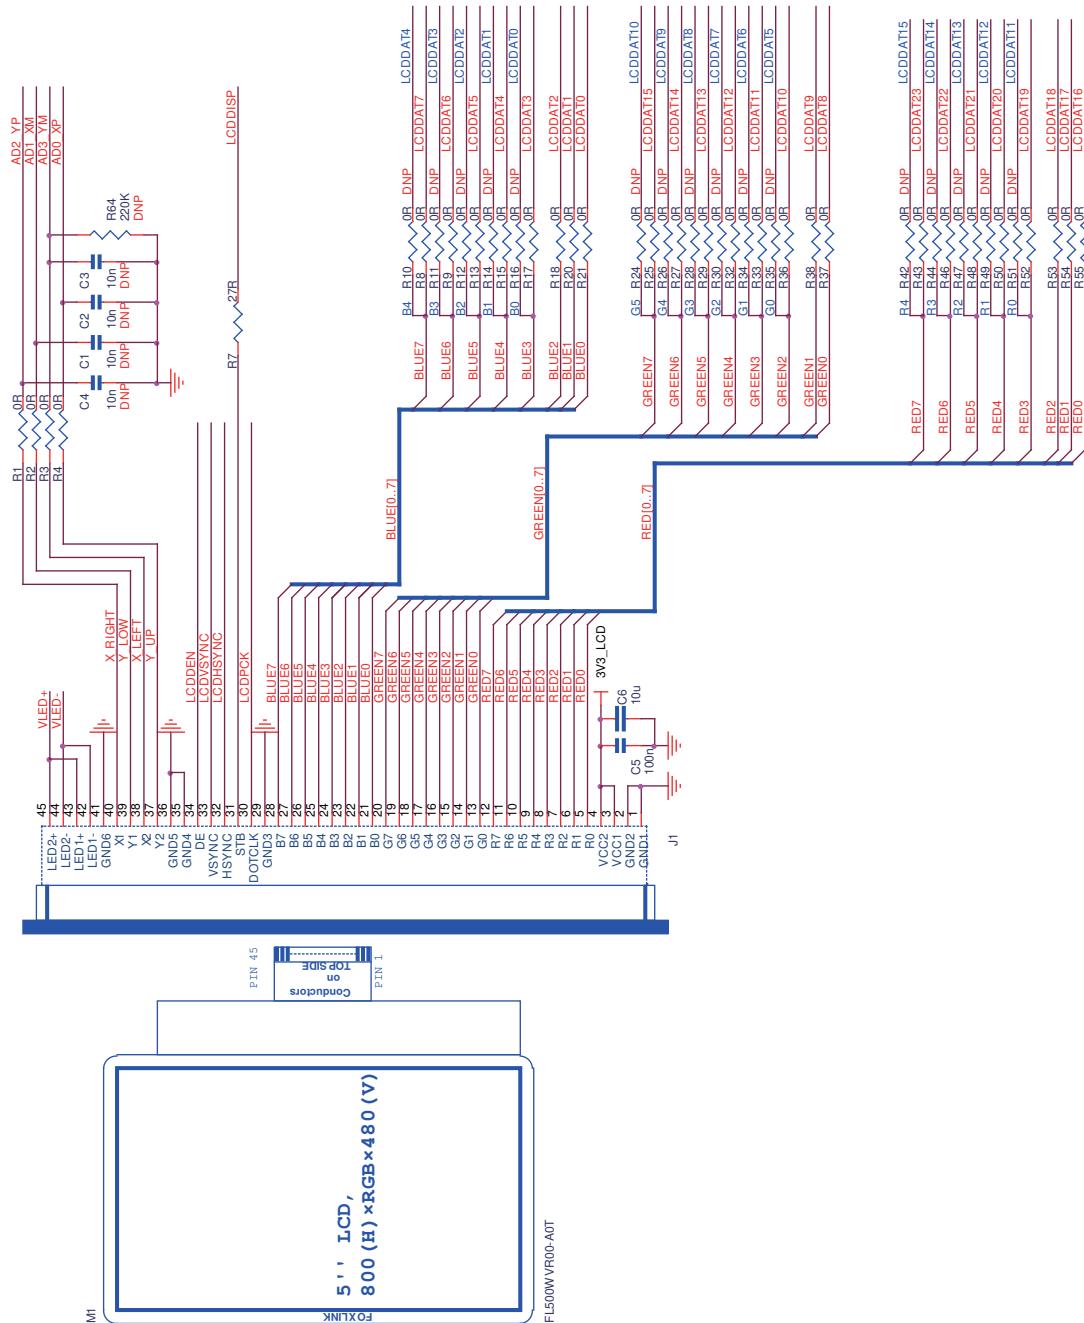

3.4.3.2 TFT LCD with Touch Panel

A 5" 800x480 LCD provides the DM with a low power display feature, back light unit and a touch panel, similar to that used on commercial PDAs.

Graphics and text can be displayed on the dot matrix panel with up to 16 million colors by supplying 24-bit data signals (8bit x RGB by default) or 16-bit data signals (5+6+5bit x RGB in option). This allows the user to develop graphical user interfaces for a wide variety of end applications.

Warning: Never connect/disconnect the LCD display from the board while the power supply is on. Doing so may damage both units.

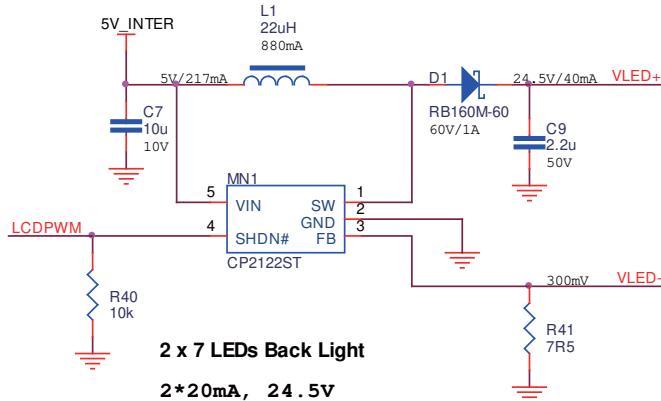

Figure 3-57. LCD with Touch Panel

3.4.3.3 Back Light

The back light voltage is generated from a CP2122ST boost converter. It is powered directly by the DC 5V from the EK board. The back light level is controlled by a PWM signal generated from the MPU Device processor.

Figure 3-58. Back Light Control

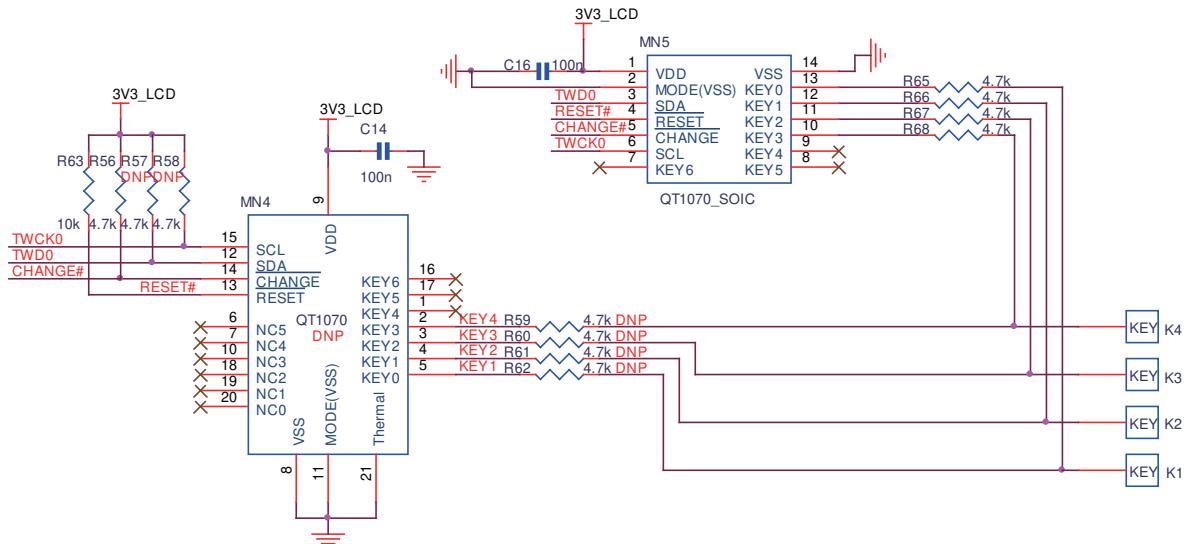

3.4.3.4 QTouch

The DM board carries a QTouch device piloted through a TWI interface. It manages four capacitive touch buttons directly printed on the PCB.

There are dual footprints for the QTouch device, and SOIC is the default mounted one.

Figure 3-59. QTouch

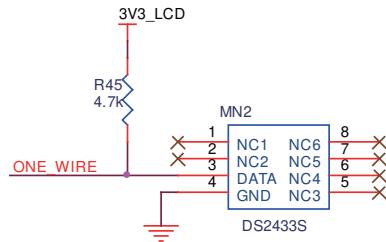

3.4.3.5

1-Wire

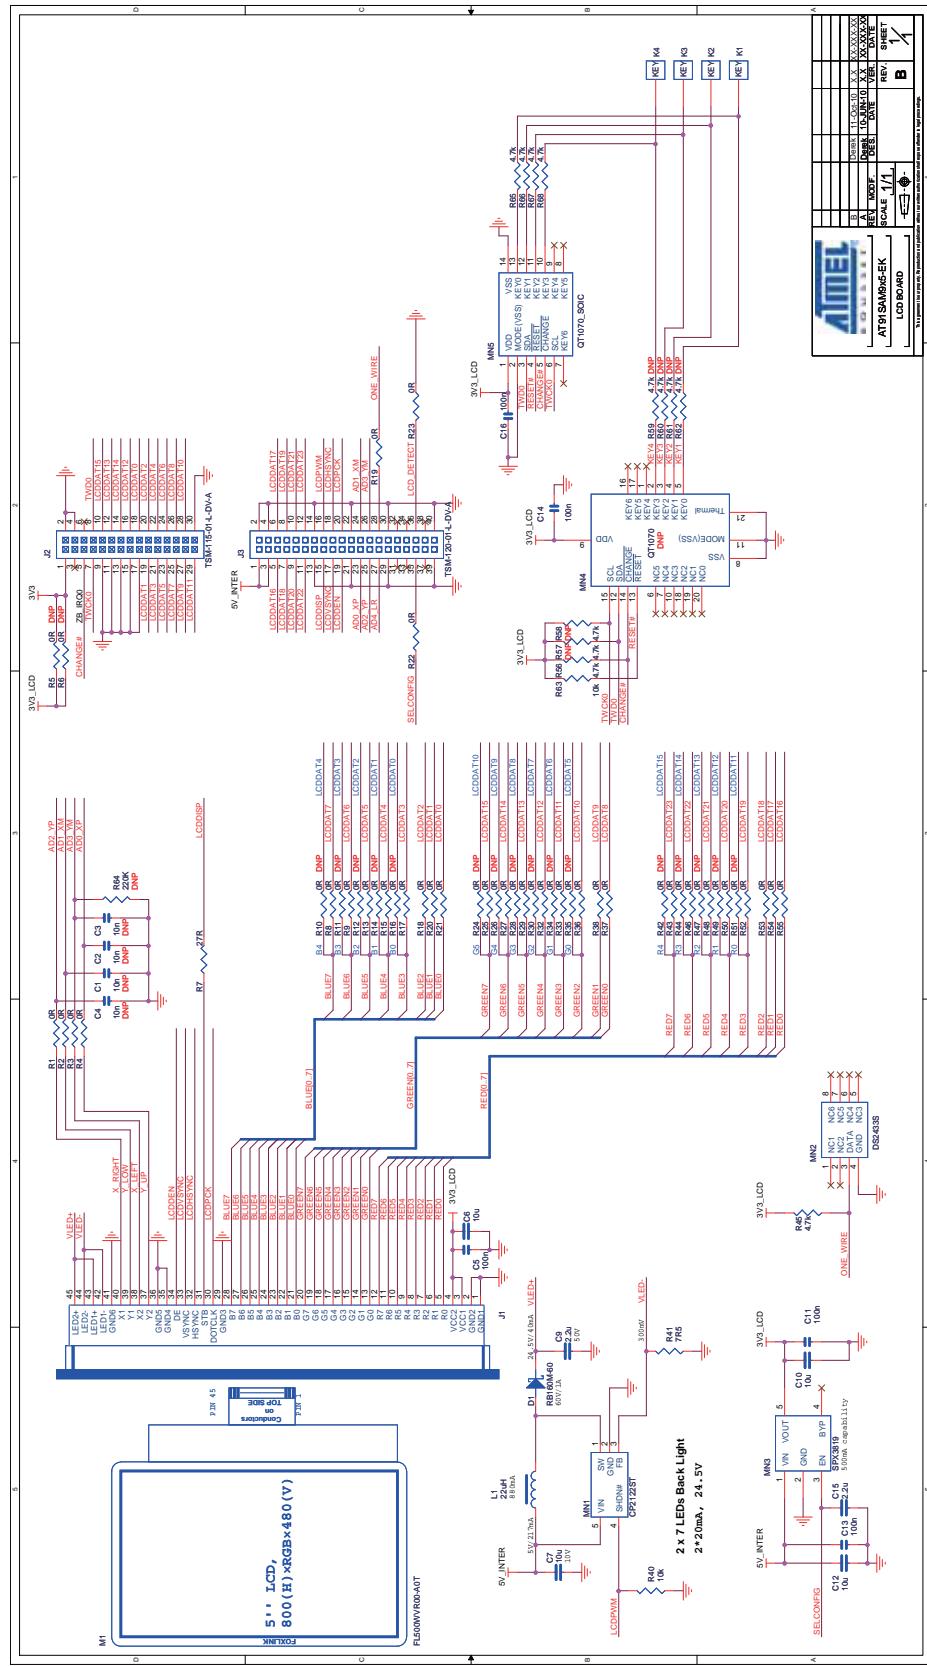

The DM board also uses a 1-Wire device as “firmware label” to store the information such as chip type, manufacturer’s name, production date etc.
