### Hex HIGH-to-LOW Level Shifter

The RCA CD54HC4050 is fabricated with high-speed silicon gate technology. These parts have a modified input protection structure that enables them to be used as logic level translators which will convert high-level logic to a low-level logic while operating off the low-level logic supply. For example, 0-V to 15-V input logic levels can be down-converted to 0-V to 5-V logic levels. The modified input protection structure protects the input from both positive and negative electrostatic discharge. These parts can also be used as simple buffers or inverters without level translation. The CD54HC4050 is an enhanced version of an equivalent CMOS type.

# 8-Channel Analog Multiplexer/Demultiplexer

The RCA CD54HC4051 and CD54HCT4051 are digitally controlled analog switches which utilize silicon-gate CMOS technology to achieve operating speeds similar to LSTTL with the low power consumption of standard CMOS integrated circuits.

These analog multiplexers/demultiplexers control analog voltages that may vary across the voltage supply range (i.e.,  $V_{\rm CC}$  to  $V_{\rm EE}$ ). They are bidirectional switches thus allowing any analog input to be used as an output and visa-versa. The switches have low "on" resistance and low "off" leakages. In addition, these devices have an enable control which, when high, disables all switches to their "off" state.
