

## Vibration-Tolerant Hall-Effect Transmission Speed and Direction Sensor IC

### FEATURES AND BENEFITS

- **Differential Hall-effect sensor** measures ring magnets and ferrous targets with inherent stray field immunity
- **SolidSpeed Digital Architecture** provides robust, adaptive performance with advanced algorithms that provide vibration immunity over the full target pitch
- **Integrated solution** includes a capacitor in a single overmolded miniature package
- **ISO 26262:2011 ASIL B** with integrated diagnostics and certified safety design process
- **Two-wire current source output** pulse-width protocol supporting speed, direction, and ASIL error reporting
- **EEPROM** enables factory traceability

### PACKAGE:

2-Pin SIP  
(suffix UB)

*Not to scale*

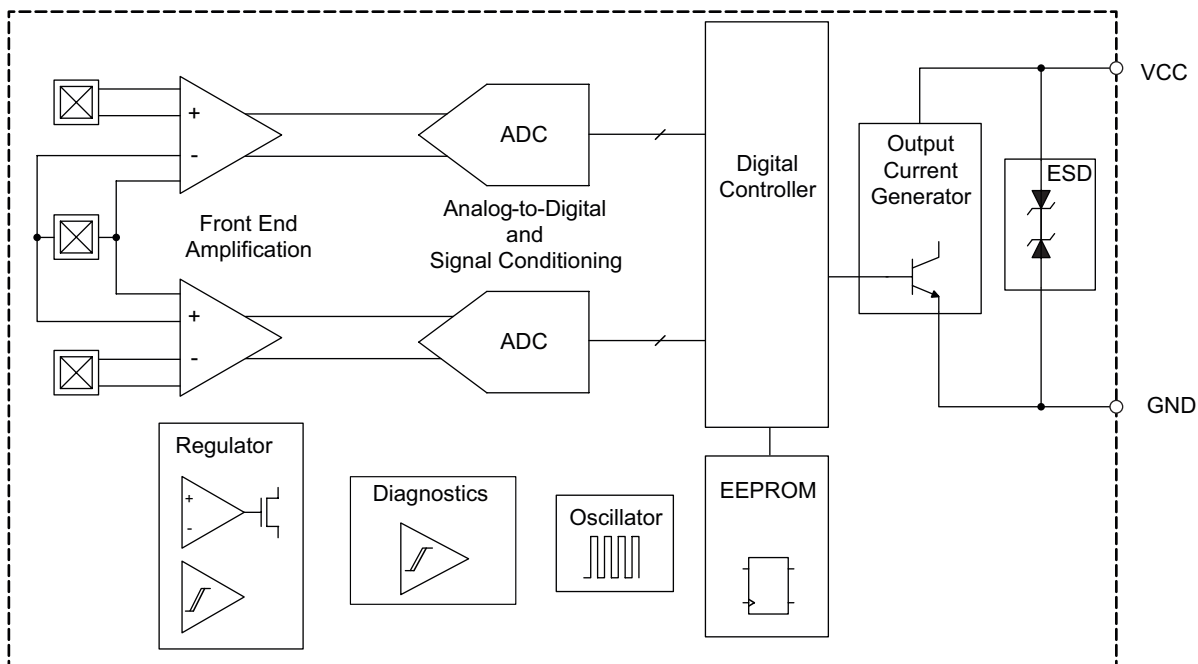

### DESCRIPTION

The A19520 is an advanced vibration-tolerant Hall-effect integrated circuit (IC) that measures the speed and direction of rotating targets. This sensor IC can directly measure ring magnets or be back-biased with a magnet to measure ferrous targets. The package features an integrated capacitor for electromagnetic compatibility (EMC).

The A19520 employs intelligent algorithms that allow stable operation during vibration and highly dynamic air gap environments common to transmission applications. In addition, the A19520 differential sensing offers inherent rejection of interfering common-mode magnetic fields.

The IC has been designed to a certified ISO 26262 design process to allow easy integration into high safety level systems. Integrated diagnostics are used to detect an IC failure that impacts the output protocol's accuracy, providing coverage compatible with ASIL B compliance.

The A19520 is provided in a 2-pin miniature SIP package (suffix UB) that is lead (Pb) free, with tin leadframe plating. The UB package includes an IC and capacitor integrated into a single overmolded package, with an additional molded lead-stabilizing bar for robust shipping and ease of assembly.

GND	2	Ground

Figure 1: Typical Application Circuit

**OPERATING CHARACTERISTICS: Valid throughout full operating and temperature ranges, unless otherwise specified**

Characteristic	Symbol	Test Conditions	Min.	Typ. [1]	Max.	Unit	
<b>GENERAL</b>							
Supply Voltage [2]	$V_{CC}$	Operating, $T_J < T_{J(max)}$ , voltage across pin 1 and pin 2; does not include voltage across $R_L$	4	–	24	V	
Undervoltage Lockout	$V_{CC(UV)}$	$V_{CC} 0 V \rightarrow 5 V$ or $5 V \rightarrow 0 V$	–	3.6	3.95	V	
Reverse Supply Current [3]	$I_{RCC}$	$V_{CC} = V_{RCC(max)}$	–10	–	–	mA	
Supply Current	$I_{CC(LOW)}$	Low-current state	5.9	7	8	mA	
	$I_{CC(HIGH)}$	High-current state	12	14	16	mA	
	$I_{CC(HIGH)} / I_{CC(LOW)}$	Ratio of high current to low current (isothermal)	1.9	–	–	–	
ASIL Safety Current	$I_{RESET}$	Refer to Figure 15	1.5	–	3.9	mA	
<b>PROTECTION CIRCUITS</b>							
Supply Zener Clamp Voltage	$V_{Zsupply}$	$I_{CC} = 19 \text{ mA}$ , $T_A = 25^\circ\text{C}$	28	–	–	V	
<b>POWER-ON CHARACTERISTICS</b>							
Power-On State	POS	$V_{CC} > V_{CC(min)}$ , as connected in Figure 1	$I_{CC(LOW)}$			mA	
Power-On Time [4]	$t_{PO}$	Time from $V_{CC} > V_{CC(min)}$ , until device has entered calibration	–	–	1	ms	
<b>OUTPUT PULSE CHARACTERISTICS, PULSE PROTOCOL [5]</b>							
Output Rise Time	$t_r$	Voltage measured at pin 2 in Figure 1, $R_L = 100 \Omega$ , $C_L = 10 \text{ pF}$ , measured between 10% and 90% of signal	UBB variant	0	2	4	$\mu\text{s}$
			UBL variant	0	4.5	8	$\mu\text{s}$
Output Fall Time	$t_f$	Voltage measured at pin 2 in Figure 1, $R_L = 100 \Omega$ , $C_L = 10 \text{ pF}$ , measured between 10% and 90% of signal	UBB variant	0	2	4	$\mu\text{s}$
			UBL variant	0	4.5	8	$\mu\text{s}$
Pulse Width, ASIL Warning	$t_{w(ASILwarn)}$	Refer to Figure 15	63	–	121	$\mu\text{s}$	
Pulse Width, ASIL Critical	$t_{w(ASILcrit)}$	Refer to Figure 15	4	–	8	ms	

Continued on next page...

[1] Typical values are at  $T_A = 25^\circ\text{C}$  and  $V_{CC} = 12 \text{ V}$ . Performance may vary for individual units, within the specified maximum and minimum limits.

[2] Maximum voltage must be adjusted for power dissipation and junction temperature; see representative for Power Derating discussions.

[3] Negative current is defined as conventional current coming out of (sourced from) the specified device terminal.

[4] Output transients prior to  $t_{PO}$  should be ignored.

[5] Timing from start of rising output transition. Measured pulse width will vary on load circuit configurations and thresholds. Pulse width measured at threshold of  $(I_{CC(HIGH)} + I_{CC(LOW)}) / 2$  for non-ASIL pulses and  $(I_{RESET} + I_{CC(LOW)}) / 2$  for ASIL pulses.

**OPERATING CHARACTERISTICS (continued): Valid throughout full operating temperature ranges,  
unless otherwise specified**

Characteristic	Symbol	Test Conditions	Min.	Typ. [1]	Max.	Unit
<b>INTERMEDIATE PULSE WIDTH OPTION (PART NUMBER -xxlxxxxx)</b>						
Threshold to Enter High-Speed Mode	$f_{HIGH}$	$T_{CYCLE}$ frequency increasing	0.935	1.1	1.265	kHz
Threshold to Exit High-Speed Mode	$f_{LOW}$	$T_{CYCLE}$ frequency decreasing	0.850	1	1.150	kHz
Pulse Width, Forward Rotation	$t_{w(FWD)}$	$T_{CYCLE}$ frequency $< f_{LOW}$	51	60	69	$\mu s$
Pulse Width, Reverse Rotation	$t_{w(REV)}$	$T_{CYCLE}$ frequency $< f_{LOW}$	102	120	138	$\mu s$
Pulse Width, High-Speed	$t_{w(HS)}$	$T_{CYCLE}$ frequency $> f_{HIGH}$	25	30	35	$\mu s$
Pulse Width, Non-Direction	$t_{w(ND)}$		25	30	35	$\mu s$
Operating Frequency, Forward Rotation [6][7][8]	$f_{FWD}$		0	–	12	kHz
Operating Frequency, Reverse Rotation [6][7][8]	$f_{REV}$		0	–	12	kHz
Operating Frequency, Non-Direction Pulses [6][8]	$f_{ND}$		0	–	12	kHz
<b>NARROW PULSE WIDTH OPTION (PART NUMBER -xxNxxxxx)</b>						
Pulse Width, Forward Rotation	$t_{w(FWD)}$		38	45	52	$\mu s$
Pulse Width, Reverse Rotation	$t_{w(REV)}$		76	90	104	$\mu s$
Pulse Width, Non-Direction	$t_{w(ND)}$		153	180	207	$\mu s$
Operating Frequency, Forward Rotation [6][8]	$f_{FWD}$		0	–	12	kHz
Operating Frequency, Reverse Rotation [6][8]	$f_{REV}$		0	–	7	kHz
Operating Frequency, Non-Direction Pulses [6][8]	$f_{ND}$		0	–	4	kHz
<b>WIDE PULSE WIDTH OPTION (PART NUMBER -xxWxxxxx)</b>						
Pulse Width, Forward Rotation	$t_{w(FWD)}$		38	45	52	$\mu s$
Pulse Width, Reverse Rotation	$t_{w(REV)}$		153	180	207	$\mu s$
Pulse Width, Non-Direction	$t_{w(ND)}$		306	360	414	$\mu s$
Operating Frequency, Forward Rotation [6][8]	$f_{FWD}$		0	–	12	kHz
Operating Frequency, Reverse Rotation [6][8]	$f_{REV}$		0	–	4	kHz
Operating Frequency, Non-Direction Pulses [6][8]	$f_{ND}$		0	–	2.2	kHz

[6] Maximum Operating Frequency is determined by satisfactory separation of output pulses. If shorter low-state durations can be resolved, the maximum  $f_{REV}$  and  $f_{ND}$  may be higher, excluding the -xxlxxxx variant or  $f_{(FWD)}$  as filter bandwidth limitation applies.

[7] Direction information is not available when frequency  $> f_{HIGH}$  for the Intermediate Pulse Width option.

[8] Zero-speed is not met when the K-variant is implemented due to the inclusion of a timed reset.

**OPERATING CHARACTERISTICS (continued): Valid throughout full operating temperature ranges,  
unless otherwise specified**

[9] Differential magnetic field is measured for Channel A (E1-E2) and Channel B (E2-E3) independently. Refer to Figure 5. Each channel's differential magnetic field is measured between two Hall elements with spacing determined by Figure 16. Magnetic field is measured orthogonally to the front of the package.

[10] Magnets and magnetic encoders decrease in magnetic strength with rising temperature. The device temperature coefficient compensates, to help maintain a consistent air gap over temperature.

[11] Additional thermal information is available on the Allegro website.

Figure 2: Differential Signal Variation

## FUNCTIONAL DESCRIPTION

The A19520 sensor IC contains a single-chip Hall-effect circuit that supports three Hall elements. These elements are used in differential pairs to provide electrical signals containing information regarding speed, direction of target rotation, and edge position. The A19520 is intended for use with ring magnet targets, or, when back-biased with an appropriate magnet, with ferrous targets. The IC detects the peaks of the magnetic signals and sets dynamic thresholds based on these detected signals. Output edges are triggered by  $B_{DIFF}$  transitions through the switch points.

### ROTATION DIRECTION

When the target is rotating such that a target feature passes from pin 1 to pin 2, this is referred to as forward rotation. This direction of rotation is indicated on the IC output by a  $t_{w(FWD)}$  pulse width. For the “-Rxxxxxxx” variant, forward direction is indicated for target rotation from pin 2 to 1.

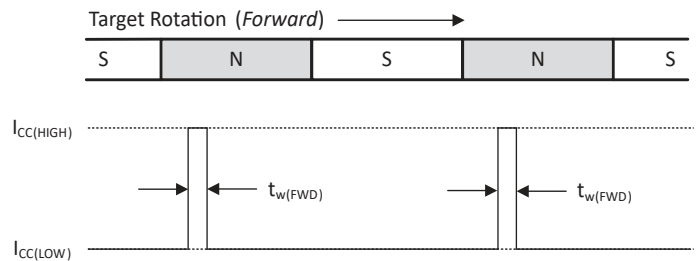

**Figure 6: Target Orientation Relative to Device (ring magnet shown).**

### General Protocol Description

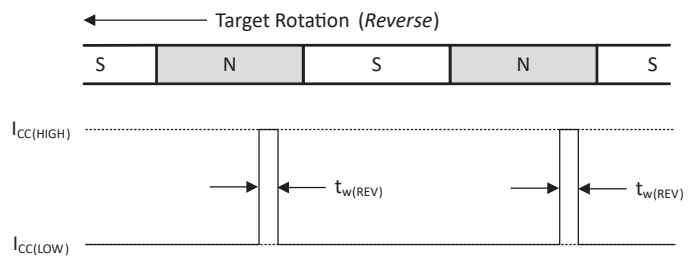

When a target passes in front of the device (opposite the branded face of the package case), the sensor IC generates an output pulse for each magnetic pole-pair of the target or for each tooth-valley pair. Speed information is provided by the output pulse rate, while direction of target rotation is provided by the duration of the output pulses. The sensor IC can sense target movement in both the forward and reverse directions.

For the “-xxIxxxxx” variant, when in High Speed Mode, output pulses will be of  $t_{w(HS)}$  duration for either target direction of rotation.

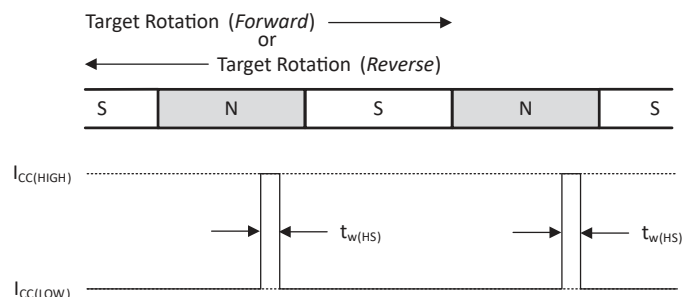

Refer to Figure 6 for target orientation to the device and Figure 7 through Figure 9 for a general output protocol understanding.

**Figure 7: Output Protocol (-Fxxxxxxx), No High Speed Mode, Forward Rotation**

**Figure 8: Output Protocol (-Fxxxxxxx), No High Speed Mode, Reverse Rotation**

**Figure 9: Output Protocol (-xxIxxxxx), High Speed Mode**

Figure 10: Basic Operation

Startup Detection/Calibration

After proper supply voltage is applied to the IC, the IC detects the magnetic profile of the rotating target.

The calibration period occurs on the first few features of the target that pass in front of the IC.

Direction information is available after calibration is complete.

Figure 11 and Figure 12 show where the first output edges may occur for various starting target phases.

Figure 11: Startup Position Effect on First Device Output Switching (-xxxxxOxx variant)

Figure 12: Startup Position Effect on First Device Output Switching (-xxxxxYxx variant)

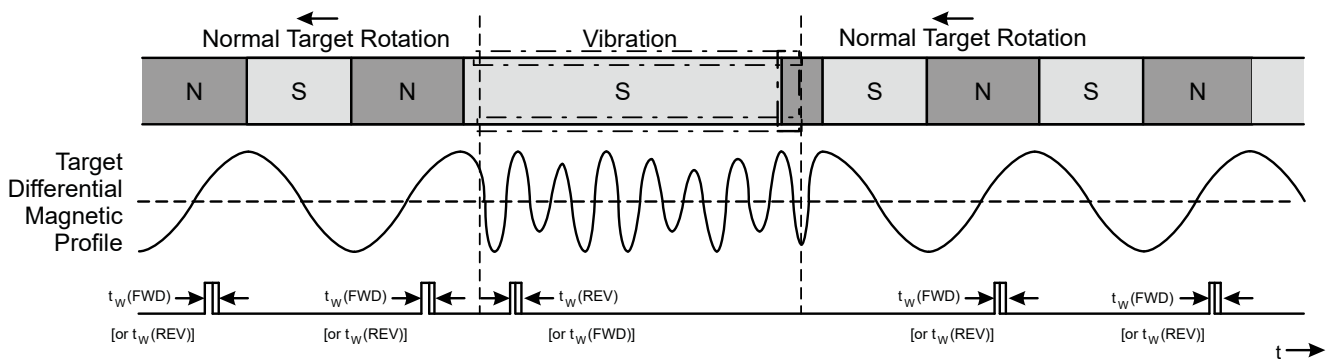

## Vibration Detection

Algorithms embedded in the IC's digital controller detect the presence of target vibration (oscillation) through analysis of the two magnetic input channels.

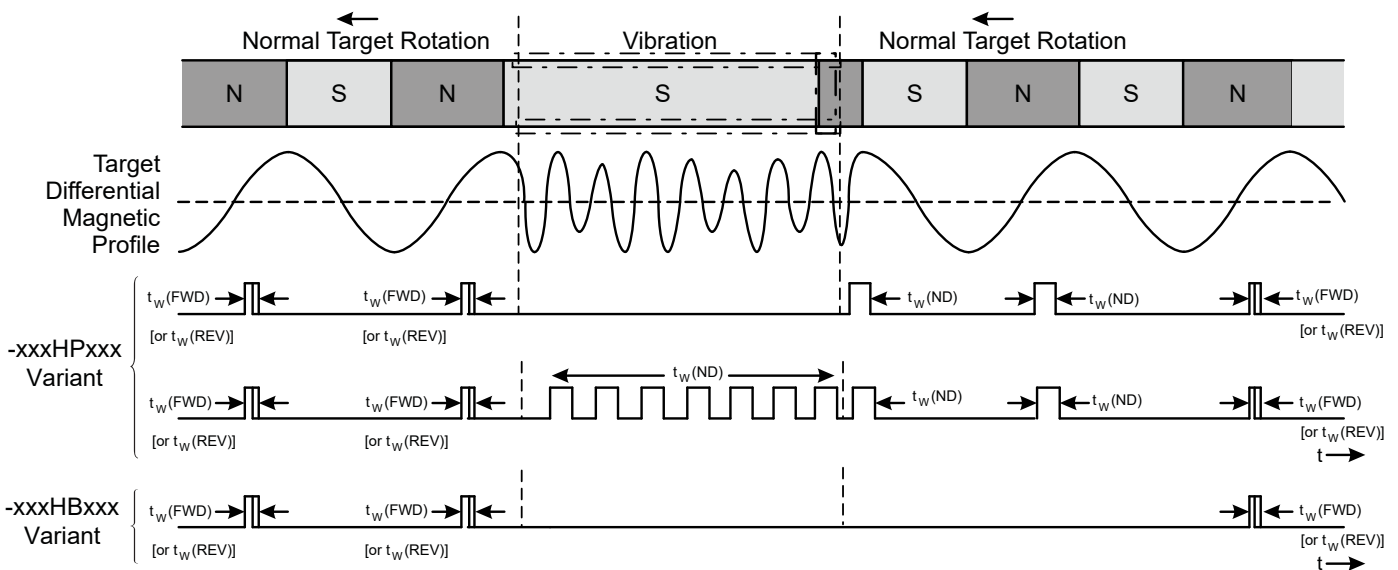

With low vibration option, during any detected vibration, the output is blanked and no output pulses will occur for vibrations less

than the specified vibration immunity. Output pulses containing the proper direction information will resume when direction information is validated on constant target rotation.

With High vibration mode, advanced algorithm detection provides additional immunity. As shown in Figure 14, the IC may produce  $t_{ND}$  pulses, depending on the vibration amplitude.

**Figure 13: Output Functionality in the Presence of Running Mode Target Vibration – Low Vibration Immunity (-xxxLBxxx variant)**

**Figure 14: Output Functionality in the Presence of Running Mode Target Vibration – High Vibration Immunity (-xxxHxxxx variant)**

## ASIL Protocol

The A19520 sensor IC contains diagnostic circuitry that will continuously monitor occurrences of failure defects within the IC. Refer to Figure 15 for the output protocol of the ASIL Safe State after an internal defect has been detected. Error Protocol will result from faults which cause incorrect signal transmission (i.e., too few or too many output pulses).

*Note: If a fault exists continuously, the device will attempt recovery indefinitely. Refer to the A19520 Safety Manual for additional details on the ASIL Safe State Output Protocol.*

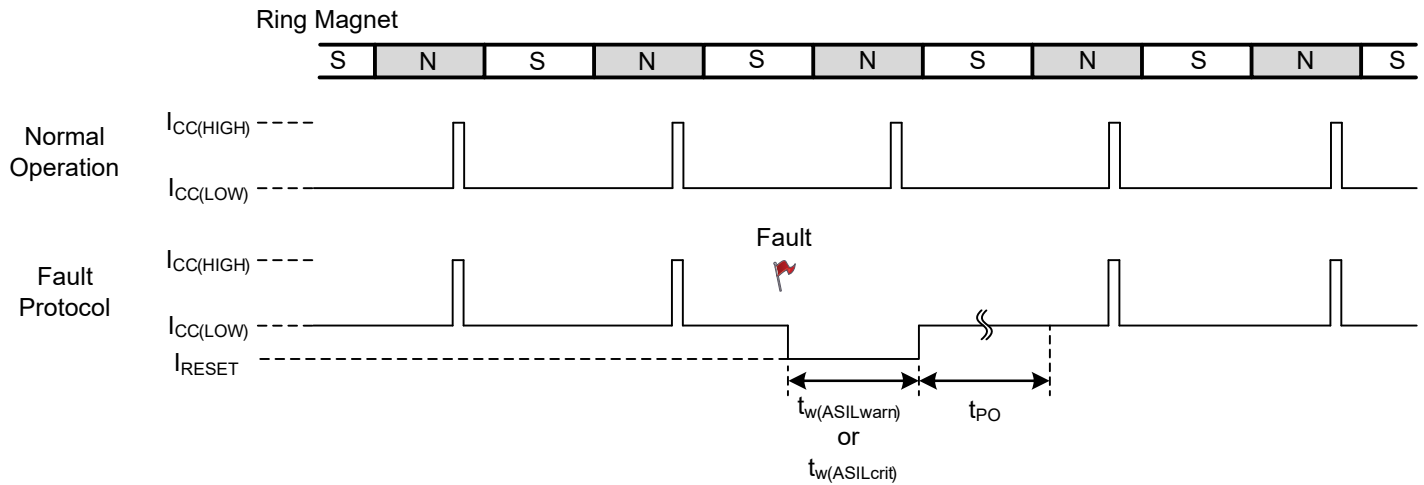

Figure 15: Output Protocol (ASIL Safe State)

## POWER DERATING

The device must be operated below the maximum junction temperature of the device ( $T_{J(max)}$ ). Under certain combinations of peak conditions, reliable operation may require derating supplied power or improving the heat dissipation properties of the application. This section presents a procedure for correlating factors affecting operating  $T_J$ . (Thermal data is also available on the Allegro MicroSystems website.)

The Package Thermal Resistance ( $R_{\theta JA}$ ) is a figure of merit summarizing the ability of the application and the device to dissipate heat from the junction (die), through all paths to the ambient air. Its primary component is the Effective Thermal Conductivity (K) of the printed circuit board, including adjacent devices and traces. Radiation from the die through the device case ( $R_{\theta JC}$ ) is a relatively small component of  $R_{\theta JA}$ . Ambient air temperature ( $T_A$ ) and air motion are significant external factors, damped by overmolding.

The effect of varying power levels (Power Dissipation or  $P_D$ ), can be estimated. The following formulas represent the fundamental relationships used to estimate  $T_J$ , at  $P_D$ .

$$P_D = V_{IN} \times I_{IN} \quad (1)$$

$$\Delta T = P_D \times R_{\theta JA} \quad (2)$$

$$T_J = T_A + \Delta T \quad (3)$$

For example, given common conditions such as:  $T_A = 25^\circ C$ ,  $V_{CC} = 12 V$ ,  $I_{CC} = 14 mA$ , and  $R_{\theta JA} = 213^\circ C/W$ , then:

$$P_D = V_{CC} \times I_{CC} = 12 V \times 14 mA = 168 mW$$

$$\Delta T = P_D \times R_{\theta JA} = 168 mW \times 213^\circ C/W = 35.8^\circ C$$

$$T_J = T_A + \Delta T = 25^\circ C + 35.8^\circ C = 60.8^\circ C$$

A worst-case estimate,  $P_{D(max)}$ , represents the maximum allowable power level ( $V_{CC(max)}$ ,  $I_{CC(max)}$ ), without exceeding  $T_{J(max)}$ , at a selected  $R_{\theta JA}$  and  $T_A$ .

*Example:* Reliability for  $V_{CC}$  at  $T_A = 150^\circ C$ , package UB, using 1-layer PCB.

Observe the worst-case ratings for the device, specifically:  $R_{\theta JA} = 213^\circ C/W$ ,  $T_{J(max)} = 165^\circ C$ ,  $V_{CC(max)} = 24 V$ , and  $I_{CC(AVG)} = 14.6 mA$ .  $I_{CC(AVG)}$  is computed using  $I_{CC(HIGH)(max)}$  and  $I_{CC(LOW)(max)}$  with a duty cycle of 83% computed from  $t_{w(REV)(max)}$  on-time at 4 kHz maximum operating frequency.

Calculate the maximum allowable power level ( $P_{D(max)}$ ). First, invert equation 3:

$$\Delta T_{max} = T_{J(max)} - T_A = 165^\circ C - 150^\circ C = 15^\circ C$$

This provides the allowable increase to  $T_J$  resulting from internal power dissipation. Then, invert equation 2:

$$P_{D(max)} = \Delta T_{max} \div R_{\theta JA} = 15^\circ C \div 213^\circ C/W = 70.4 mW$$

Finally, invert equation 1 with respect to voltage:

$$V_{CC(est)} = P_{D(max)} \div I_{CC(AVG)} = 70.4 mW \div 14.6 mA = 4.8 V$$

The result indicates that, at  $T_A$ , the application and device can dissipate adequate amounts of heat  $\leq 4.8 V$  at  $150^\circ C$ .

Compare  $V_{CC(est)}$  to  $V_{CC(max)}$ . If  $V_{CC(est)} \leq V_{CC(max)}$ , then reliable operation between  $V_{CC(est)}$  and  $V_{CC(max)}$  requires enhanced  $R_{\theta JA}$ . If  $V_{CC(est)} \geq V_{CC(max)}$ , then operation between  $V_{CC(est)}$  and  $V_{CC(max)}$  is reliable under these conditions.

## PACKAGE OUTLINE DRAWING

## Revision History

Number	Date	Description
–	December 17, 2018	Initial release
1	October 31, 2019	Corrected Output Fall Time symbol (page 4), footnotes (page 6), B <sub>DIFF</sub> symbols and magnet polarity (page 9), and package branding (page 14).
2	October 15, 2020	Updated Operate and Release Point values (page 6).
3	April 21, 2021	Added UBL variant (pages 2-4).
4	March 14, 2023	Updated Power Derating (page 13) to read “The result indicates that, at T <sub>A</sub> , the application and device can dissipate adequate amounts of heat ≤4.8 V at 150°C”, and other minor editorial updates
