			SHEET 1 OF 38																		

1. SCOPE

1.1 Scope. This drawing documents three product assurance class levels consisting of space application (device class V), high reliability (device classes M and Q), and nontraditional performance environment (device class N). A choice of case outlines and lead finishes are available and are reflected in the Part or Identifying Number (PIN). When available, a choice of Radiation Hardness Assurance (RHA) levels are reflected in the PIN. For device class N, the user is cautioned to assure that the device is appropriate for the application environment.

1.2 PIN. The PIN is as shown in the following example:

1.2.1 RHA designator. Device classes N, Q, and V RHA marked devices meet the MIL-PRF-38535 specified RHA levels and are marked with the appropriate RHA designator. Device class M RHA marked devices meet the MIL-PRF-38535, appendix A specified RHA levels and are marked with the appropriate RHA designator. A dash (-) indicates a non-RHA device.

1.2.2 Device type(s). The device type(s) identify the circuit function as follows:

<u>Device type</u>	<u>Generic number</u>	<u>Circuit function</u>	<u>Temperature Range</u>	<u>Speed</u>
01	80502	32-bit Microprocessor	-55°C to +125°C	50/100 MHz
02	80502	32-bit Microprocessor	-40°C to +110°C	50/100 MHz
03	80502	32-bit Microprocessor	-40°C to +85°C	50/100 MHz
04	80502	32-bit Microprocessor	-55°C to +125°C	60/120 MHz
05	80502	32-bit Microprocessor	-40°C to +110°C	60/120 MHz
06	80502	32-bit Microprocessor	-40°C to +85°C	60/120 MHz
07	80502	32-bit Microprocessor	-55°C to +125°C	66/133 MHz
08	80502	32-bit Microprocessor	-40°C to +110°C	66/133 MHz
09	80502	32-bit Microprocessor	-40°C to +85°C	66/133 MHz

1.2.3 Device class designator. The device class designator is a single letter identifying the product assurance level as follows:

<u>Device class</u>	<u>Device requirements documentation</u>
M	Vendor self-certification to the requirements for MIL-STD-883 compliant, non-JAN class level B microcircuits in accordance with MIL-PRF-38535, appendix A
N	Certification and qualification to MIL-PRF-38535 with a nontraditional performance environment 1/
Q or V	Certification and qualification to MIL-PRF-38535

1.2.4 Case outline(s). The case outline(s) are as designated in MIL-STD-1835 and as follows:

<u>Outline letter</u>	<u>Descriptive designator</u>	<u>Terminals</u>	<u>Package style</u>
X	See figures 1	296	Staggered Pin Grid Array

1/ Any device outside the traditional performance environment; e.g., an operating temperature range of -55°C to +125°C and which requires hermetic packaging.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-94578
		REVISION LEVEL	SHEET 2

1.2.5 Lead finish. The lead finish is as specified in MIL-PRF-38535 for device classes N, Q, and V or MIL-PRF-38535, appendix A for device class M.

1.3 Absolute maximum ratings. 2/

Storage Temperature Range	-65° C to +150° C
Case Temperature Under Bias	-65° C to +125° C
3 V Supply Voltage with respect to Ground	-0.5 V dc to +4.1 V dc
3 V Only Buffer Input Voltage with respect to Ground	-0.5 V dc to V _{CC} + 0.5 V dc (not to exceed 4.6 V)
5V Safe Buffer Input Voltage with respect to Ground	-0.5 V dc to 6.5 V dc
Lead Temperature (soldering 10 seconds)	300° C
Thermal Resistance, Junction-to-case (θ_{JC}): Case X	1.7° C/W 3/
Thermal Resistance, Junction-to-ambient (θ_{JA}): Case X	16.2° C/W 3/ 4/

1.4 Recommended operating conditions.

Case Operating Temperature Range	
device type 01, 04 and 07	-55° C to +125° C
device type 02, 05 and 08	-40° C to +110° C
device type 03, 06 and 09	-40° C to +85° C
Supply Voltage, V _{CC3}	3.135 V dc < V _{CC} < 3.465 V dc
Supply Voltage, V _{CC2}	2.935 V dc < V _{CC} < 3.265 V dc

1.5 Digital logic testing for device classes Q and V.

Fault coverage measurement of manufacturing logic tests (MIL-STD-883, test method 5012) 97.6 percent

2. APPLICABLE DOCUMENTS

2.1 Government specification, standards, and handbooks. The following specification, standards, and handbooks form a part of this drawing to the extent specified herein. Unless otherwise specified, the issues of these documents are those listed in the issue of the Department of Defense Index of Specifications and Standards (DoDISS) and supplement thereto, cited in the solicitation.

SPECIFICATION

MILITARY

MIL-PRF-38535 - Integrated Circuits, Manufacturing, General Specification for.

STANDARDS

MILITARY

MIL-STD-883 - Test Methods and Procedures for Microelectronics.
MIL-STD-973 - Configuration Management.
MIL-STD-1835 - Microcircuit Case Outlines.

HANDBOOKS

MILITARY

MIL-HDBK-103 - List of Standard Microcircuit Drawings (SMD's).
MIL-HDBK-780 - Standard Microcircuit Drawings.

(Unless otherwise indicated, copies of the specification, standards, bulletin, and handbook are available from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2/ Stresses above the absolute maximum rating may cause permanent damage to the device. Extended operation at the maximum levels may degrade performance and affect reliability.

3/ Without heat sink.

4/ Zero airflow.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-94578
		REVISION LEVEL	SHEET 3

2.2 Non Government publications. The following document(s) for a part of this document to the extent specified herein. Unless otherwise specified, the issues of the documents which are DOD adopted are those listed in the issue of the DODISS cited in the solicitation. Unless otherwise specified, the issues of documents not listed in the DODISS are the issues of the documents cited in the solicitation.

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE Standard 1149.1 - IEEE Standard Test Access Port and Boundary Scan Architecture.

(Applications for copies should be addressed to the Institute of Electrical and Electronics Engineers, 445 Hoes Lane, Piscataway, NJ 08854-4150.)

(Non-Government standards and other publications are normally available from the organizations that prepare or distribute the documents. These documents may also be available in or through libraries or other informational services.)

2.3 Order of precedence. In the event of a conflict between the text of this drawing and the references cited herein, the text of this drawing takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. REQUIREMENTS

3.1 Item requirements. The individual item requirements for device classes N, Q, and V shall be in accordance with MIL-PRF-38535 and as specified herein or as modified in the device manufacturer's Quality Management (QM) plan. The modification in the QM plan shall not affect the form, fit, or function as described herein. The individual item requirements for device class M shall be in accordance with MIL-PRF-38535, appendix A for non-JAN class level B devices and as specified herein.

3.2 Design, construction, and physical dimensions. The design, construction, and physical dimensions shall be as specified in MIL-PRF-38535 and herein for device classes N, Q, and V or MIL-PRF-38535, appendix A and herein for device class M.

3.2.1 Case outline. The case outline shall be in accordance with 1.2.4 herein and figure 1.

3.2.2 Terminal connections. The terminal connections shall be as specified on figure 2.

3.2.3 Block diagram. The block diagram shall be as specified on figure 3.

3.2.4 Waveform. The waveform shall be as specified on figure 4.

3.2.5 Boundary Scan Instruction Codes. For all devices the boundary scan instruction codes shall be as specified on figure 5.

3.3 Electrical performance characteristics and postirradiation parameter limits. Unless otherwise specified herein, the electrical performance characteristics and postirradiation parameter limits are as specified in table I and shall apply over the full case operating temperature range.

3.4 Electrical test requirements. The electrical test requirements shall be the subgroups specified in table II. The electrical tests for each subgroup are defined in table I.

3.5 Marking. The part shall be marked with the PIN listed in 1.2 herein. In addition, the manufacturer's PIN may also be marked as listed in MIL-HDBK-103. For packages where marking of the entire SMD PIN number is not feasible due to space limitations, the manufacturer has the option of not marking the "5962-" on the device. For RHA product using this option, the RHA designator shall still be marked. Marking for device classes N, Q, and V shall be in accordance with MIL-PRF-38535. Marking for device class M shall be in accordance with MIL-PRF-38535, appendix A.

3.5.1 Certification/compliance mark. The certification mark for device classes N, Q, and V shall be a "QML" or "Q" as required in MIL-PRF-38535. The compliance mark for device class M shall be a "C" as required in MIL-PRF-38535, appendix A.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-94578
		REVISION LEVEL	SHEET 17

- 1/ Unless otherwise specified, all testing to be performed using worst-case conditions. The 50 and 60 Mhz bus operations no 100% tested, they are guaranteed by design/characterization. Full functionality is verified at both minimum and maximum bus frequency in the production test program.
- 2/ This value should be used for power supply design. It was determined using a worst case instruction mix and $V_{CC3} = 3.465 V$, $V_{CC2} = 3.265 V$. Power supply transient response and decoupling capacitors must be sufficient to handle the instantaneous current changes occurring during transitions from stop clock to full active modes.
- 3/ Not 100 percent tested. Guaranteed by design/characterization.
- 4/ These signals are measured on the rising edge of adjacent CLKs at 1.5 V. To ensure a 1:1 relationship between the amplitude of the input jitter and the internal and external clocks, the jitter frequency spectrum should not have any power spectrum peaking between 500 kHz and 1/3 of the CLK operating frequency. The amount of jitter present must be accounted for as a component of CLK skew between devices.
- 5/ $0.8 V/ns \leq CLK$ input rise/fall time $\leq 8 V/ns$.
- 6/ APCHK, FERR, HLDA, TERR, LOCK, and PCHK are glitch-free outputs. Glitch-free signals monotonically transition without false transitions (i.e., glitches).
- 7/ In dual processing mode, timing t_{14} is replaced by t_{83a} . Timing t_{14} is required for external snooping (e.g., address setup to the CLK in which EADS is sampled active) in both uniprocessor and dual processor modes.
- 8/ Setup time is required to guarantee recognition on a specific clock. The device must meet this specification for dual processor operation for the FLUSH and RESET signals.
- 9/ This input may be driven asynchronously. However, when operating two processing mode, FLUSH and RESET must be asserted synchronously to both processors.
- 10/ Hold time is required to guarantee recognition on a specific clock. The device must meet this specification for dual processor operation for the FLUSH and RESET signals.
- 11/ When driven asynchronously, RESET, NMI, FLUSH, R/S, INIT, and SMT must be de-asserted (inactive) for a minimum of 2 clocks before being returned active.
- 12/ To guarantee proper asynchronous recognition, the signal must have been de-asserted (inactive) for a minimum of 2 clocks before being returned active and must meet the minimum pulse width.
- 13/ TFRMC should be tied to V_{CC} (high) to ensure proper operation of the device as a primary processor.
- 14/ BRDYC, BUSCHK are used as reset configuration signals to select buffer size.
- 15/ BF and CPUTYP should be strapped to V_{CC} or V_{SS} .
- 16/ Referenced to TCK falling edge.
- 17/ 1 ns can be added to the maximum TCK rise and fall times for every 10 Mhz of frequency below 33 Mhz.
- 18/ Referenced to TCK rising edge.
- 19/ Nontest outputs and inputs are the normal output or input signals (besides TCK, TRST, TDI, TDO, and TMS). These timings correspond to the response of these signals due to boundary scan operations.
- 20/ During probe mode operation, do not use the boundary scan timings (t_{55-58}).

3.6 Certificate of compliance. For device classes N, Q, and V, a certificate of compliance shall be required from a QML-38535 listed manufacturer in order to supply to the requirements of this drawing (see 6.6.1 herein). For device class M, a certificate of compliance shall be required from a manufacturer in order to be listed as an approved source of supply in MIL-HDBK-103 (see 6.6.2 herein). The certificate of compliance submitted to DSCC-VA prior to listing as an approved source of supply for this drawing shall affirm that the manufacturer's product meets, for device classes N, Q, and V, the requirements of MIL-PRF-38535 and herein or for device class M, the requirements of MIL-PRF-38535, appendix A and herein.

3.7 Certificate of conformance. A certificate of conformance as required for device classes N, Q, and V in MIL-PRF-38535 or for device class M in MIL-PRF-38535, appendix A shall be provided with each lot of microcircuits delivered to this drawing.

3.8 Notification of change for device class M. For device class M, notification to DSCC-VA of change of product (see 6.2 herein) involving devices acquired to this drawing is required for any change as defined in MIL-STD-973.

3.9 Verification and review for device class M. For device class M, DSCC, DSCC's agent, and the acquiring activity retain the option to review the manufacturer's facility and applicable required documentation. Offshore documentation shall be made available onshore at the option of the reviewer.

3.10 Microcircuit group assignment for device class M. Device class M devices covered by this drawing shall be in microcircuit group number 105 (see MIL-PRF-38535, appendix A).

4. QUALITY ASSURANCE PROVISIONS

4.1 Sampling and inspection. For device classes N, Q, and V, sampling and inspection procedures shall be in accordance with MIL-PRF-38535 or as modified in the device manufacturer's Quality Management (QM) plan. The modification in the QM plan shall not affect the form, fit, or function as described herein. For device class M, sampling and inspection procedures shall be in accordance with MIL-PRF-38535, appendix A.

4.2 Screening. For device classes N, Q, and V, screening shall be in accordance with MIL-PRF-38535, and shall be conducted on all devices prior to qualification and technology conformance inspection. For device class M, screening shall be in accordance with method 5004 of MIL-STD-883, and shall be conducted on all devices prior to quality conformance inspection.

4.2.1 Additional criteria for device class M.

a. Burn-in test, method 1015 of MIL-STD-883.

(1) Test condition A, B, C or D. The test circuit shall be maintained by the manufacturer under document revision level control and shall be made available to the preparing or acquiring activity upon request. The test circuit shall specify the inputs, outputs, biases, and power dissipation, as applicable, in accordance with the intent specified in test method 1015 of MIL-STD-883.

(2) $T_A = +125^\circ\text{C}$, minimum.

b. Interim and final electrical test parameters shall be as specified in table II herein.

4.2.2 Additional criteria for device classes N, Q, and V.

a. The burn-in test duration, test condition and test temperature, or approved alternatives shall be as specified in the device manufacturer's QM plan in accordance with MIL-PRF-38535. The burn-in test circuit shall be maintained under document revision level control of the device manufacturer's Technology Review Board (TRB) in accordance with MIL-PRF-38535 and shall be made available to the acquiring or preparing activity upon request. The test circuit shall specify the inputs, outputs, biases, and power dissipation, as applicable, in accordance with the intent specified in test method 1015 of MIL-STD-883.

b. Interim and final electrical test parameters shall be as specified in table II herein.

c. Additional screening for device class V beyond the requirements of device class Q shall be as specified in MIL-PRF-38535, appendix B.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-94578
		REVISION LEVEL	SHEET 29

4.3 Qualification inspection for device classes N, Q, and V. Qualification inspection for device classes N, Q, and V shall be in accordance with MIL-PRF-38535. Inspections to be performed shall be those specified in MIL-PRF-38535 and herein for groups A, B, C, D, and E inspections (see 4.4.1 through 4.4.4).

4.4 Conformance inspection. Technology conformance inspection for classes N, Q, and V shall be in accordance with MIL-PRF-38535 including groups A, B, C, D, and E inspections and as specified herein except where option 2 of MIL-PRF-38535 permits alternate in-line control testing. Quality conformance inspection for device class M shall be in accordance with MIL-PRF-38535, appendix A and as specified herein. Inspections to be performed for device class M shall be those specified in method 5005 of MIL-STD-883 and herein for groups A, B, C, D, and E inspections (see 4.4.1 through 4.4.4).

4.4.1 Group A inspection.

- a. Tests shall be as specified in table II herein.
- b. For device class M, subgroups 7 and 8 tests shall be sufficient to verify the functionality of the device. For device classes N, Q, and V, subgroups 7 and 8 shall include verifying the functionality of the device; these tests shall have been fault graded in accordance with MIL-STD-883, test method 5012 (see 1.5 herein).
- c. Subgroup 4 (C_{IN} , C_O , $C_{I/O}$, C_{CLK} , C_{TIN} , C_{TOUT} , and C_{TCK} measurements) shall be measured only for the initial test and after process or design changes which may affect input capacitance. A minimum sample size of 5 devices with zero rejects shall be required.

4.4.2 Group C inspection. The group C inspection end-point electrical parameters shall be as specified in table II herein.

TABLE II. Electrical test requirements.

Test requirements	Subgroups (in accordance with MIL-STD-883, method 5005, table I)	Subgroups (in accordance with MIL-PRF-38535, table III)		
	Device class M	Device class N	Device class Q	Device class V
Interim electrical parameters (see 4.2)				1,7,9
Final electrical parameters (see 4.2)	1,2,3,7,8, 9,10,11 <u>1/</u>	2,3, 8, 10,11 <u>1/</u>	2,3, 8, 10,11 <u>1/</u>	1,2,3,7,8, 9,10,11 <u>2/</u>
Group A test requirements (see 4.4)	1,2,3,4,7,8,9,10,11	1,2,3,4,7,8,9, 10,11	1,2,3,4,7,8,9, 10,11	1,2,3,4,7,8,9, 10,11
Group C end-point electrical parameters (see 4.4)	2,5,8,10	2,5,8,10	2,5,8,10	2,5,8,10
Group D end-point electrical parameters (see 4.4)	2,5,8,10	2,5,8,10	2,5,8,10	2,5,8,10
Group E end-point electrical parameters (see 4.4)	1,7,9	1,7,9	1,7,9	1,7,9

1/ PDA applies to subgroup 2.

2/ PDA applies to subgroups 2 and 8a.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-94578
		REVISION LEVEL	SHEET 30

4.4.2.1 Additional criteria for device class M. Steady-state life test conditions, method 1005 of MIL-STD-883:

- a. Test condition A, B, C or D. The test circuit shall be maintained by the manufacturer under document revision level control and shall be made available to the preparing or acquiring activity upon request. The test circuit shall specify the inputs, outputs, biases, and power dissipation, as applicable, in accordance with the intent specified in test method 1005 of MIL-STD-883.
- b. $T_A = +125^\circ\text{C}$, minimum.
- c. Test duration: 1,000 hours, except as permitted by method 1005 of MIL-STD-883.

4.4.2.2 Additional criteria for device classes N, Q, and V. The steady-state life test duration, test condition and test temperature, or approved alternatives shall be as specified in the device manufacturer's QM plan in accordance with MIL-PRF-38535. The test circuit shall be maintained under document revision level control by the device manufacturer's TRB, in accordance with MIL-PRF-38535, and shall be made available to the acquiring or preparing activity upon request. The test circuit shall specify the inputs, outputs, biases, and power dissipation, as applicable, in accordance with the intent specified in test method 1005 of MIL-STD-883.

4.4.3 Group D inspection. The group D inspection end-point electrical parameters shall be as specified in table II herein.

4.4.4 Group E inspection. Group E inspection is required only for parts intended to be marked as radiation hardness assured (see 3.5 herein).

- a. End-point electrical parameters shall be as specified in table II herein.
- b. For device classes N, Q, and V, the devices or test vehicle shall be subjected to radiation hardness assured tests as specified in MIL-PRF-38535 for the RHA level being tested. For device class M, the devices shall be subjected to radiation hardness assured tests as specified in MIL-PRF-38535, appendix A for the RHA level being tested. All device classes must meet the postirradiation end-point electrical parameter limits as defined in table I at $T_A = +25^\circ\text{C} \pm 5^\circ\text{C}$, after exposure, to the subgroups specified in table II herein.
- c. When specified in the purchase order or contract, a copy of the RHA delta limits shall be supplied.

5. PACKAGING

5.1 Packaging requirements. The requirements for packaging shall be in accordance with MIL-PRF-38535 for device classes N, Q, and V or MIL-PRF-38535, appendix A for device class M.

6. NOTES

6.1 Intended use. Microcircuits conforming to this drawing are intended for use for Government microcircuit applications (original equipment), design applications, and logistics purposes.

6.1.1 Replaceability. Microcircuits covered by this drawing will replace the same generic device covered by a contractor-prepared specification or drawing.

6.1.2 Substitutability. Device class Q devices will replace device class M devices.

6.2 Configuration control of SMD's. All proposed changes to existing SMD's will be coordinated with the users of record for the individual documents. This coordination will be accomplished in accordance with MIL-STD-973 using DD Form 1692, Engineering Change Proposal.

6.3 Record of users. Military and industrial users should inform Defense Supply Center Columbus when a system application requires configuration control and which SMD's are applicable to that system. DSCC will maintain a record of users and this list will be used for coordination and distribution of changes to the drawings. Users of drawings covering microelectronic devices (FSC 5962) should contact DSCC-VA, telephone (614) 692-0525.

6.4 Comments. Comments on this drawing should be directed to DSCC-VA, Columbus, Ohio 43216-5000, or telephone (614) 692-0547.

6.5 Abbreviations, symbols, and definitions. The abbreviations, symbols, and definitions used herein are defined in MIL-I-38535 and MIL-STD-1331 and as follows:

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-94578
		REVISION LEVEL	SHEET 31

<u>Pin symbol</u>	<u>Type</u>	<u>Description</u>
A20M	I	When the address bit 20 mask pin is asserted, the device emulates the address wraparound at 1 Mbyte which occurs on the 8086. When A20M is asserted, the device masks physical address bit 20(A20) before performing a lookup to the internal caches or driving a memory cycle on the bus. The effect of A20M is undefined in protected mode. A20M must be asserted only when the processor is in real mode. A20M is internally masked by the device when configured as a Dual processor.
A31-A3	I/O	As outputs, the address lines of the processor along with the byte enables define the physical area of memory or I/O accessed. The external system drives the inquire address to the processor on A31-A5.
ADS	O	The address status indicates that a new valid bus cycle is currently being driven by the device.
AHOLD	I	In response to the assertion of address hold, the device will stop driving the address lines (A31-A3), and AP in the next clock. The rest of the bus will remain active so data can be returned or driven for previously issued bus cycles.
AP	I/O	Address parity is driven by the device with even parity information on all the device generated cycles in the same clock that the address is driven. Even parity must be driven back to the device during inquire cycles on this pin in the same clock as EADS to ensure that correct parity check status is indicated by the device.
APCHK	O	The address parity check status pin is asserted two clocks after EADS is sampled active if the device has detected a parity error on the address bus during inquire cycles. APCHK will remain active for one clock each time a parity error is detected (including during dual processing private snooping).
(APICEN) PICD1	I	Advanced programmable interrupt controller enable is a new pin that enables or disables the on-chip APIC interrupt controller. If sampled high at the falling edge of RESET, the APIC is enabled. APICEN shares a pin with the programmable interrupt controller data 1 signal.
BE7-BE5 BE4-BE0	O I/O	The byte enable pins are used to determine which bytes must be written to external memory, or which bytes were requested by the CPU for the current cycle. The byte enables are driven in the same clock as the address lines (A31-3). Unlike the 60/66 MHz device, the lower 4-byte enables (BE3-BE0) are used on the device as APIC ID inputs and are sampled at RESET. After RESET, these behave exactly like the 60/66 MHz device byte enables. In dual processing mode, BE4 is used as an input during flush cycles.
BF(1:0)	I	Bus frequency determines the bus-to-core frequency ratio. BF is sampled at RESET, and cannot be changed until another nonwarm (1 ms) assertion of RESET. Additionally, BF must not change values while RESET is active. For proper operation of the device this pin should be strapped high or low. When BF is strapped to V _{CC} , the processor will operate at a 2/3 bus/core frequency ratio. When BF is strapped to V _{SS} , the processor will operate at a 1/2 bus/core frequency ratio. If BF is left floating, the device defaults to a 2/3 bus ratio. Note that core operation at either 75 Mhz or 90 Mhz does not allow 1/2 bus/core frequency, while core operation at 120 Mhz and 133 Mhz does not allow 2/3 bus core frequency.
BOFF	I	The backoff input is used to abort all outstanding bus cycles that have not yet completed. In response to BOFF, the device will float all pins normally floated during bus hold in the next clock. The processor remains in bus hold until BOFF is negated, at which time the device restarts the aborted bus cycle(s) in their entirety.

		REVISION LEVEL	SHEET 32

<u>Pin symbol</u>	<u>Type</u>	<u>Description</u> - Continued.
BP(3:2) PM/BP(1:0)	O	<p>The breakpoint pins (BP3-0) correspond to the debug registers, DR3-DR0. These pins externally indicate a breakpoint match when the debug registers are programmed to test for breakpoint matches.</p> <p>BP1 and BP0 are multiplexed with the performance monitoring pins (PM1 and PM0). The PB1 and PB0 bits in the debug mode control register determine if the pins are configured as breakpoint or performance monitoring pins. The pins come out of RESET configured for performance monitoring.</p>
BRDY	I	The burst ready input indicates that the external system has presented valid data on the data pins in response to a read or that the external system has accepted the device data in response to a write request. This signal is sampled in the T2, T12, and T2P bus states.
BREQ	O	The bus request output indicates to the external system that the device has internally generated a bus request. This signal is always driven whether or not the device is driving its bus.
BUSCHK	I	<p>The bus check input allows the system to signal an unsuccessful completion of a bus cycle. If this pin is sampled active, the device will latch the address and control signals in the machine check registers. If, in addition, the MCE bit in CR4 is set, the device will vector to the machine check exception.</p> <p>NOTE: To assure that the BUSCHK will always be recognized, STPCLK must be deasserted any time BUSCHK is asserted by the system, before the system allows another external bus cycle. If BUSCHK is asserted by the system for a snoop cycle while STPCLK remains asserted, usually (if MCE = 1) the processor will vector to the exception after STPCLK is deasserted. But if another snoop to the same line occurs during STPCLK assertion, the processor can lose the BUSCHK request.</p>
CACHE	O	For the device-initiated cycles the cache pin indicates internal cacheability of the cycle (if a read), and indicates a burst write back cycle (if a write). If this pin is driven inactive during a read cycle, the device will not cache the returned data, regardless of the state of the KEN pin. This pin is also used to determine the cycle length (number of transfers in the cycle).
CLK	I	<p>The clock input provides the fundamental timing for the device. Its frequency is the operating frequency for the device external bus, and requires TTL levels. All external timing parameters except TDI, TDO, TMS, TRST, and PICD0-1 are specified with respect to the rising edge of CLK.</p> <p>NOTE: It is recommended the CLK begin toggling within 150 ms after V_{CC} reaches its proper operating level. This recommendation is only to ensure long-term reliability of the device.</p>
D/C	O	The data/code output is one of the primary bus cycle definition pins. It is driven valid in the same clock as the ADS signal is asserted. D/C distinguishes between data and code or special cycles.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-94578
		REVISION LEVEL	SHEET 33

<u>Pin symbol</u>	<u>Type</u>	<u>Description</u> - Continued.	
D63-d0	I/O	These are the 64 data lines for the processor. Lines D7-D0 define the least significant byte of the data bus; lines D63-D56 define the most significant byte of the data bus. When the CPU is driving the data lines, they are driven during the T2, T12, or T2P clocks for that cycle. During reads, the CPU samples the data bus when BRDY is returned.	
DP7-DP0	I/O	These are the data parity pins for the processor. There is one for each byte of the data bus. They are driven by the device with even parity information on writes in the same clock as write data. Even parity information must be driven back to the device on these pins in the same clock as the data to ensure that the correct parity check status is indicated by the device. DP7 applies to D63-56, DP0 applies to D7-0.	
EADS	I	This signal indicates that a valid external address has been driven onto the device address pins to be used for an inquire cycle.	
EWBE	I	The external write buffer empty input, when inactive (high), indicates that a write cycle is pending in the external system. When the device generates a write, and EWBE is sampled inactive, the device will hold off all subsequent writes to all E- or M-state lines in the data cache until all write cycles have completed, as indicated by EWBE being active.	
FERR	O	The floating point error pin is driven active when an unmasked floating point error occurs. FERR is similar to the ERROR pin on the 5962-89534 device math coprocessor. FERR is included for compatibility with systems using DOS type floating point error reporting. FERR is never driven active by the dual processor.	
FLUSH	I	<p>When asserted, the cache flush input forces the device to write back all modified lines in the data cache and invalidate its internal caches. A flush acknowledge special cycle will be generated by the device indicating completion of the write back and invalidation.</p> <p>If FLUSH is sampled low when RESET transitions from high to low, three-state test mode is entered.</p> <p>If two devices are operating in dual processing mode in a system and FLUSH is asserted, the dual processor will perform a flush first (without a flush acknowledge cycle), then the primary processor will perform a flush followed by a flush acknowledge cycle.</p> <p>NOTE: If the FLUSH signal is asserted in dual processing mode, it must be deasserted at least one clock prior to BRDY of the FLUSH acknowledge cycle to avoid DP arbitration problems.</p>

		REVISION LEVEL	SHEET 34

<u>Pin symbol</u>	<u>Type</u>	<u>Description</u> - Continued.
HTT	O	The hit indication is driven to reflect the outcome of an inquire cycle. If an inquire cycle hits a valid line in either the device data or instruction cache, this pin is asserted two clocks after EADS is sampled asserted. If the inquire cycle misses the device cache, this pin is negated two clocks after EADS. This pin changes its value only as a result of an inquire cycle and retains its value between the cycles.
HTTM	O	The hit to a modified line output is driven to reflect the outcome of an inquire cycle. It is asserted after inquire cycles which resulted in a hit to a modified line in the data cache. It is used to inhibit another bus master from accessing the data until the line is completely written back.
HILDA	O	The bus hold acknowledge pin goes active in response to a hold request driven to the processor on the HOLD pin. It indicates that the device has floated most of the output pins and relinquished the bus to another local bus master. When leaving bus hold, HLDA will be driven inactive and the device will resume driving the bus. If the device has a bus cycle pending, it will be driven in the same clock that HLDA is de-asserted.
HOLD	I	In response to the bus hold request, the device will float most of its output and input/output pins and assert HLDA after completing all outstanding bus cycles. The device will maintain its bus in this state until HOLD is de-asserted. HOLD is not recognized during LOCK cycles. The device will recognize HOLD during reset.
TERR	O	The internal error pin is used to indicate two types of errors, internal parity errors and functional redundancy errors. If a parity error occurs on a read from an internal array, the device will assert the TERR pin for one clock and then shutdown. If the device is configured as a checker and a mismatch occurs between the value sampled on the pins and the corresponding value computed internally, the device will assert TERR two clocks after the mismatched value is returned.
TGNNE	I	This is the ignore numeric error input. This pin has no effect when the NE bit in CR0 is set to 1. When the CR0.NE bit is 0, and the TGNNE pin is asserted, the device will ignore any pending unmasked numeric exception and continue executing floating-point instructions for the entire duration that this pin is asserted. When the CR0.NE bit is 0, TGNNE is not asserted, a pending unmasked numeric exception exists (SW.ES = 1), and the floating point instruction is one of FINIT, FCLEX, FSTENV, FSAVE, FSTSW, FSTCW, FENI, FDISI, or FSETPM, the device will execute the instruction in spite of the pending exception. When the CR0.NE bit is 0, TGNNE is not asserted, a pending unmasked numeric exception exists (SW.ES = 1), and the floating point instruction is one of FINIT, FCLEX, FSTENV, FSAVE, FSTSW, FSTCW, FENI, FDISI, or FSETPM, the device will stop execution and wait for an external interrupt. TGNNE is internally masked when the device is configured as a dual processor.
INIT	I	The device initialization input pin forces the device to begin execution in a known state. The processor state after INIT is the same as the state after RESET except that the internal caches, write buffers, and floating point registers retain the values they had prior to INIT. INIT may NOT be used in lieu of RESET after power-up. If INIT is sampled high when RESET transitions from high to low, the device will perform built-in self test prior to the start of program execution.

		REVISION LEVEL	SHEET 35

<u>Pin symbol</u>	<u>Type</u>	<u>Description</u> - Continued.
INTR	I	An active maskable interrupt input indicates that an external interrupt has been generated. If the IF bit in the EFLAGS register is set, the device will generate two locked interrupt acknowledge bus cycles and vectro to an interrupt handler after the current instruction execution is completed. INTR must remain active until the first interrupt acknowledge cycle is generated to assure that the interrupt is recognized.
INV	I	The invalidation input determines the final cache line state (S or 1) in case of an inquire cycle hit. It is sampled together with the address for the inquire cycle in the clock EADS is sampled active.
KEN	I	The cache enable pin is used to determine whether the current cycle is cacheable or not and is consequently used to determine cycle length. When the device generates a cycle that can be cached (CACHE asserted) and KEN is active, the cycle will be transformed into a burst line fill cycle.
LOCK	O	The bus lock pin indicates that the current bus cycle is locked. The device will not allow a bus hold when LOCK is asserted (but AHOLD and BOFF are allowed). LOCK goes active in the first clock of the first locked bus cycle and goes inactive after the BRDY is returned for the last licted bus cycle. LOCK is guaranteed to be de-asserted for at least one clock between back-to-back locked cycles.
M/TO	O	The memory/input-output is one of the primary bus cycle definition pins. It is driven valid in the same clock as the ADS signal is asserted. M/TO distinguishes between memory and I/O cycles.
NA	I	An active next address input indicates that the external memory system is ready to accept a new bus cycle although all data transfers for the current cycle have not yet completed. The device will issue ADS for a pending cycle two clocks after NA is asserted. The device supports up to two outstanding bus cycles.
NMI	I	The nonmaskable interrupt request signal indicates that an external nonmaskable interrupt has been generated.
PCD	O	The page cache disable pin reflects the state of the PCD bit in CR3, the page directory entry, or the page table entry. The purpose of PCD is to provide an external cacheability indication on a page by page basis.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-94578
		REVISION LEVEL	SHEET 36

<u>Pin symbol</u>	<u>Type</u>	<u>Description</u> - Continued.
PCHK	O	The parity check output indicates the result of a parity check on a data read. It is driven with parity status two clocks after BRDY is returned. PCHK remains low one clock for each clock in which a parity error was detected. Parity is checked only for the bytes on which valid data is returned. When two device are operating in dual processing mode, PEN may be driven two or three clocks after BRDY is returned.
PEN	I	The parity enable input (along with CR4.MCE) determines whether a machine check exception will be taken as a result of a data parity error on a read cycle. If this pin is sampled active in the clock a data parity error is detected, the device will latch the address and control signals of the cycle with the parity error in the machine check registers. If, in addition, the machine check enable bit in CR4 is set to "1", the device will vector to the machine check exception before the beginning of the next instruction.
PM/BP(1:0)	O	These pins function as part of the performance monitoring feature. The breakpoint 1-0 pins are multiplexed with the performance monitoring 1-0 pins. The BP1 and PB0 bits in the debug mode control register determine if the pins are configured as breakpoint or performance monitoring pins. The pins come out of RESET configured for performance monitoring.
PRDY	O	The probe ready output pin indicates that the processor has stopped normal execution in response to the R/S pin going active, or probe mode being enter
PWT	O	The page write through pin reflects the state of the PWT bit in CR3, the page directory entry, or the page table entry. The PWT pin is used to provide an external write back indication on a page-by-page basis.
R/S	I	The run/stop input is an asynchronous, edge-sensitive interrupt used to stop the normal execution of the processor and place it into an idle state. A high to low transition on the R/S pin will interrupt the processor and cause it to stop execution at the next instruction boundary.
RESET	I	RESET forces the device to begin execution at a known state. All the devices internal caches will be invalidated upon the RESET. Modified lines in the data cache are not written back. FLUSH, FROMC, and INIT are sampled when RESET transitions from high to low to determine if three-state test mode or checker mode will be entered, or if BIST will be run.
SCYC	O	The split cycle output is asserted during misaligned LOCKed transfers to indicate that more than two cycles will be locked together. This signal is defined for locked cycles only. It is undefined for cycles which are not locked.

		REVISION LEVEL	SHEET 37

<u>Pin symbol</u>	<u>Type</u>	<u>Description</u> - Continued.
SMT	I	The system management interrupt causes a system management interrupt request to be latched internally. When the latched SMT is recognized on an instruction boundary, the processor enters system management mode.
SMTACT	O	An active system management interrupt active output indicates that the processor is operating in system management mode.
STPCLK	I	Assertion of the stop clock input signifies a request to stop the internal clock of the device thereby causing the core to consume less power. When the CPU recognizes STPCLK, the processor will stop execution on the next instruction boundary, unless superseded by a higher priority interrupt, and generate a stop grant acknowledge cycle. When STPCLK is asserted, the device will still respond to interprocessor and external snoop requests.
TCK	I	The testability clock input provides the clocking function for the device boundary scan in accordance with the IEEE Boundary Scan Interface (Standard 1149.1). It is used to clock state information and data into and out of the device during boundary scan.
TDI	I	The test data input is a serial input for the test logic. TAP instructions and data are shifted into the device on the TDI pin on the rising edge of TCK when the TAP controller is in an appropriate state.
TDO	O	The test data output is a serial output of the test logic. TAP instructions and data are shifted out of the device on the TDO pin on TCK's falling edge when the TAP controller is in an appropriate state.
TMS	I	The value of the test mode select input signal sampled at the rising edge of TCK controls the sequence of TAP controller state changes.
TRST	I	When asserted, the test reset input allows the TAP controller to be asynchronously initialized.
V _{CC}	I	The device has 53 3.3 V power inputs.
V _{SS}	I	The device has 53 ground inputs.
W/R	O	Write/read is one of the primary bus cycle definition pins. It is driven valid in the same clock as the ADS signal is asserted. W/R distinguishes between write and read cycles.
WB/WT	I	The write back/write through input allows a data cache line to be defined as write back or write through on a line-by-line basis. As a result, it determines whether a cache line is initially in the S or E state in the data cache.

6.6 Sources of supply.

6.6.1 Sources of supply for device classes N, Q, and V. Sources of supply for device classes N, Q, and V are listed in QML-38535. The vendors listed in QML-38535 have submitted a certificate of compliance (see 3.6 herein) to DSCC-VA and have agreed to this drawing.

6.6.2 Approved sources of supply for device class M. Approved sources of supply for class M are listed in MIL-HDBK-103. The vendors listed in MIL-HDBK-103 have agreed to this drawing and a certificate of compliance (see 3.6 herein) has been submitted to and accepted by DSCC-VA.

STANDARD MICROCIRCUIT DRAWING SOURCE APPROVAL BULLETIN

DATE: 97-02-05

Approved sources of supply for SMD 5962-94578 are listed below for immediate acquisition only and shall be added to MIL-HDBK-103 during the next revision. MIL-HDBK-103 will be revised to include the addition or deletion of sources. The vendors listed below have agreed to this drawing and a certificate of compliance has been submitted to and accepted by DSCC-VA. This bulletin is superseded by the next dated revision of MIL-HDBK-103.
