Dual 14-bit 500 MSPS Digital to Analog Converter

FEATURES

- **Dual Channel**
- **14-Bit Resolution**
- **Maximum Sample Rate: 500 MSPS**
- **Pin Compatible with DAC3154/DAC3164 and DAC3151/DAC3161/DAC3171**
- **Input Interface:**
  - **14 LVDS Inputs**
  - **Single 14-bit wide interface or Dual 7-bit wide interface**
  - **Single or dual DDR data clock**
  - **Internal FIFO**
- **Chip to Chip Synchronization**
- **Power Dissipation: 460mW**
- **Spectral Performance at 20 MHz IF**
  - **SNR: 76 dBFS**
  - **SFDR: 78 dBc**
- **Current sourcing DACs**
- **Compliance Range: –0.5V to 1V**
- **Package: 64 pin QFN (9x9mm)**

APPLICATIONS

- **Multi-carrier, Multi-mode Cellular Infrastructure Base Stations**
- **Radar**
- **Signal Intelligence**
- **Software-defined Radio**
- **Test and Measurement Instrumentation**

DESCRIPTION

The DAC3174 is a dual channel 14-bit, 500 MSPS digital-to-analog converter (DAC). The DAC3174 uses a 14-bit wide LVDS digital bus with 1 or 2 independent data clocks for flexibility in providing each channel's data from different data sources. An input FIFO allows independent data and sample clocks. FIFO input and output pointers can be synchronized across multiple devices for precise signal synchronization. The DAC outputs are current sourcing and terminate to GND with a compliance range of –0.5 to 1V. DAC3174 is pin compatible with the dual-channel, 12-/10-bit, 500 MSPS digital-to-analog converter DAC3164/DAC3154 and single-channel, 14-/12-/10-bit, 500 MSPS digital-to-analog converter DAC3171/DAC3161/DAC3151.

The device is available in a QFN-64 PowerPAD™ package is specified over the full industrial temperature range (–40°C to 85°C).

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

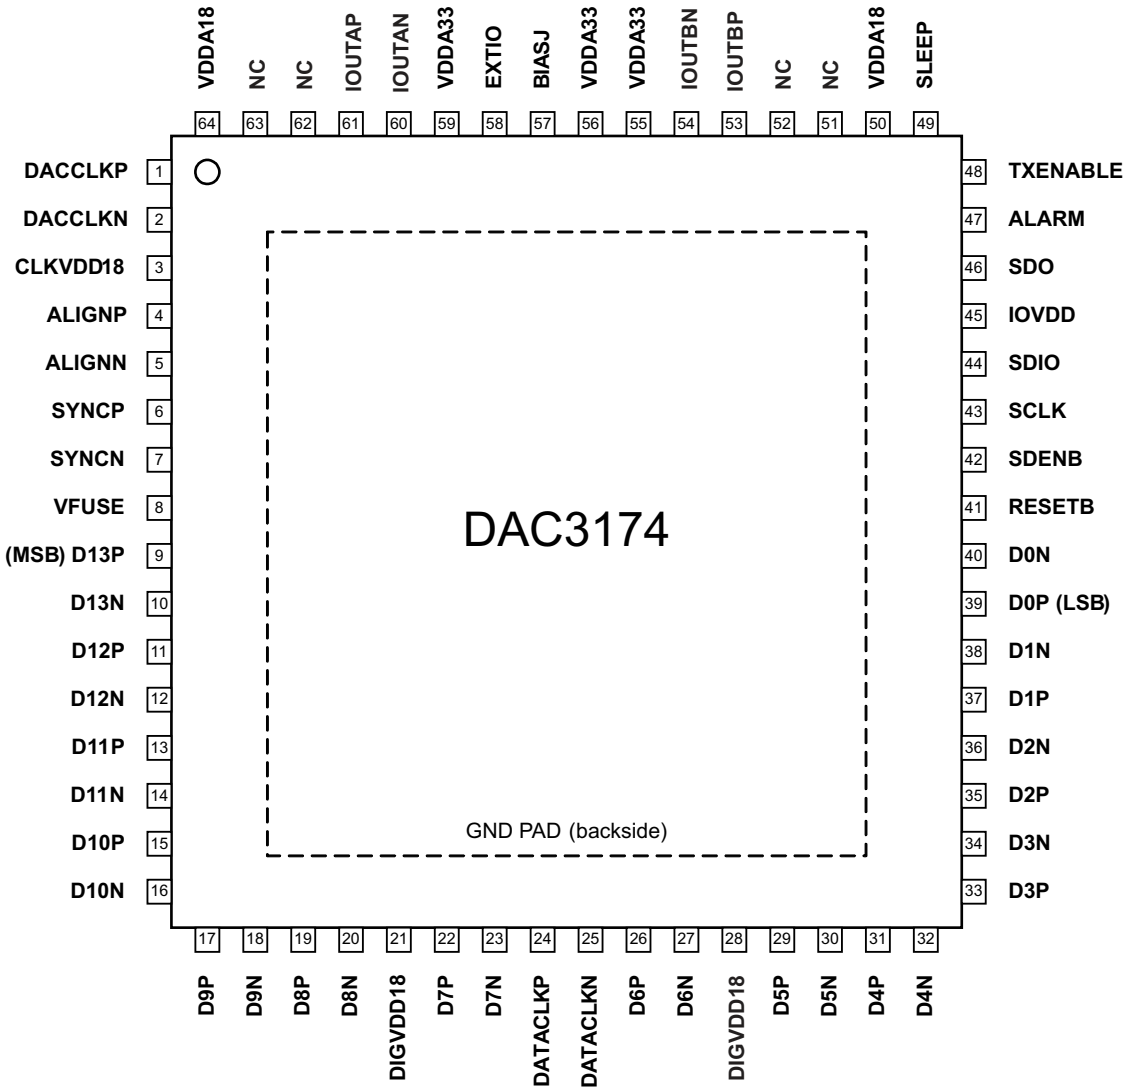
PINOUT – SINGLE BUS MODE



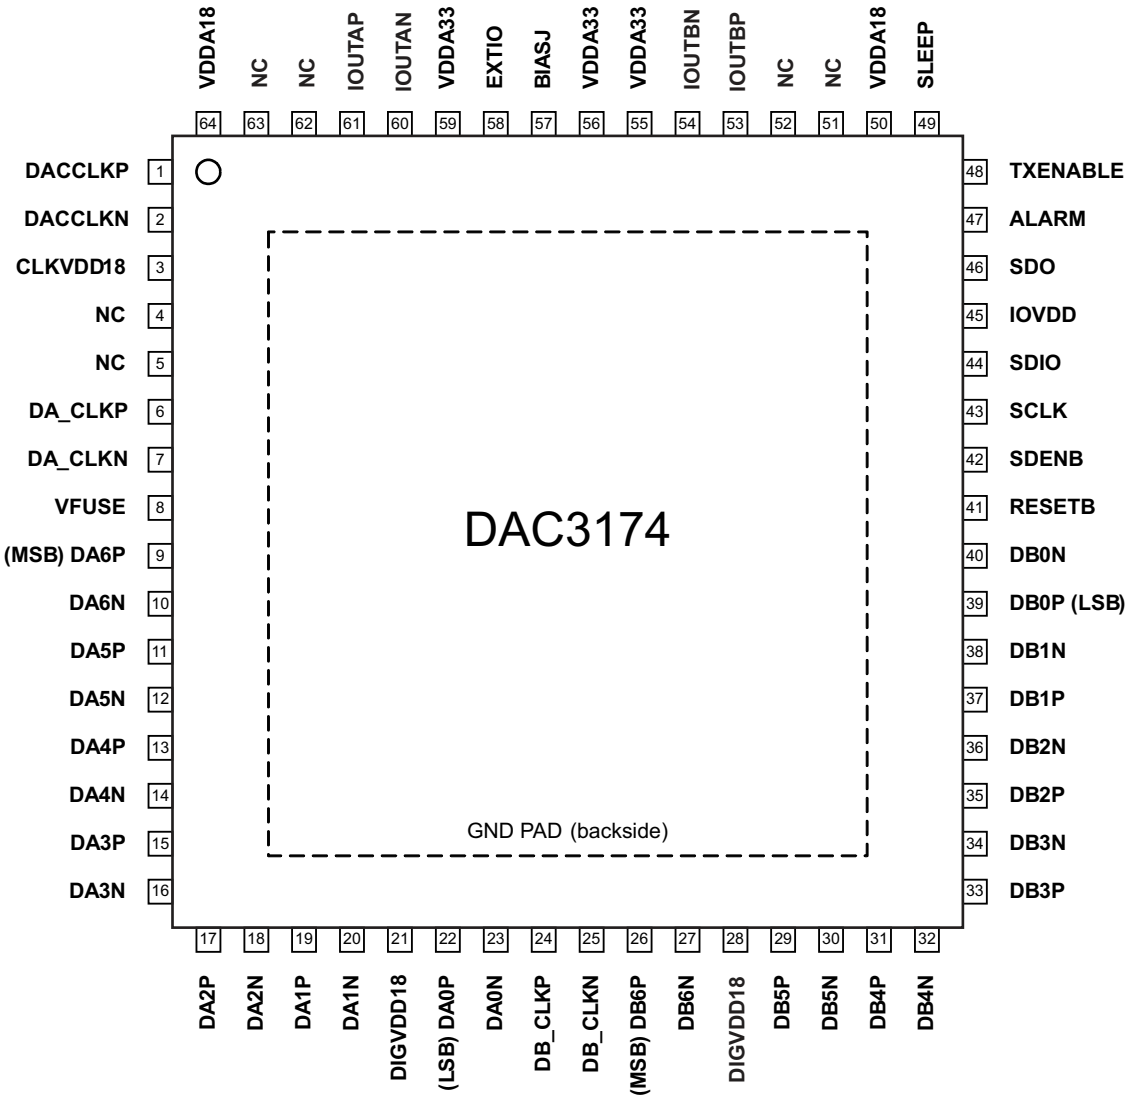
PIN ASSIGNMENT TABLE – SINGLE BUS MODE

PIN		I/O	DESCRIPTION
NAME	NO.		
CONTROL/SERIAL			
SCLK	43	I	Serial interface clock. Internal pull-down.
SDENB	42	I	Serial interface clock. Internal pull-up.
SDIO	44	I/O	Bi-directional serial data in 3 pin mode (default). In 4-pin interface mode (register sif4_ena (config 0, bit 9)), the SDIO pin in an input only. Internal Pull-down.
SDO	46	O	Uni-directional serial interface data in 4 pin mode (register sif4_ena (config 0, bit 9)). The SDO pin is tri-stated in 3-pin interface mode (default). Internal Pulldown.
RESETB	41	I	Serial interface reset input. Active low. Initialized internal registers during high to low transition. Asynchronous. Internal pull-up.
ALARM	47	O	CMOS output for ALARM condition.
TXENABLE	48	I	Transmit enable active high input. TXENABLE must be high for the DATA to the DAC to be enabled. When TXENABLE is low, the digital logic section is forced to all 0, and any input data is ignored. Internal pull-down.
SLEEP	49	I	Puts device in sleep, active high. Internal pull-down.

PIN ASSIGNMENT TABLE – SINGLE BUS MODE (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
DATA INTERFACE			
DATA[13:0]P/N	9/10-19/20 22/23 26/27 29/30-39/40	I	LVDS input data bits for both channels. Each positive/negative LVDS pair has an internal 100 Ω termination resistor. Data format relative to DATACLKP/N clock is Double Data Rate (DDR) with two data transfers per DATACKP/N clock cycle. The data format is interleaved with channel A (rising edge) and channel B falling edge. In the default mode (reverse bus not enabled): DATA13P/N is most significant data bit (MSB) DATA0P/N is most significant data bit (LSB)
DATACLKP/N	24/25	I	DDR differential input data clock. Edge to center nominal timing. Ch A rising edge, Ch B falling edge in multiplexed output mode.
SYNCP/N	6/7	I	Reset the FIFO or to be used as a syncing source. These two functions are captured with the rising edge of DATACLKP/N. The signal captured by the falling edge of DATACLKP/N.
ALIGNP/N	4/5	I	LVPECL FIFO output synchronization. This positive/negative pair is captured with the rising edge of DACCLKP/N. It is used to reset the clock dividers and for multiple DAC synchronization. If unused it can be left unconnected.
OUTPUT/CLOCK			
DACCLKP/N	½	I	LVPECL clock input for DAC core with a self-bias of approximately CLKVDD18/2.
IOUTAP/N	61/60	O	A-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full scale current source and the most positive voltage on the IOUTAP pin. Similarly, a 0xFFFF data input results in a 0 mA current source and the least positive voltage on the IOUTAP pin.
IOUTBP/N	53/54	O	B-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full scale current source and the most positive voltage on the IOUTBP pin. Similarly, a 0xFFFF data input results in a 0 mA current source and the least positive voltage on the IOUTBP pin.
REFERENCE			
EXTIO	58	I/O	Used as external reference input when internal reference is disabled. Requires a 0.1 µF decoupling capacitor to GND when used as reference output.
BIASJ	57	O	Full-scale output current bias. For 20 mA full-scale output current, connect a 960 Ω resistor to GND.
POWER SUPPLY			
IOVDD	45	I	Supply voltage for CMOS IO's. 1.8V – 3.3V.
CLKVDD18	3	I	1.8V clock supply
DIGVDD18	21, 28	I	1.8V digital supply. Also supplies LVDS receivers.
VDDA18	50, 64	I	Analog 1.8V supply
VDDA33	55, 56, 59	I	Analog 3.3V supply
VFUSE	8	I	Digital supply voltage. (1.8V) This supply pin is also used for factory fuse programming. Connect to DVDD pins for normal operation.
NC	51, 52 62, 63		Not used. These pins can be left open or tied to GROUND in actual application use.

PIN OUT – DUAL BUS MODE



PIN ASSIGNMENT TABLE – DUAL BUS MODE

PIN ASSIGNMENT TABLE – DUAL BUS MODE (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
DATA INTERFACE			
DA[6:0]P/N	9/10-19/20 22/23	I	LVDS positive input data bits for channel A. Each positive/negative LVDS pair has an internal 100 Ω termination resistor. Data format relative to DA_CLKP/N clock is Double Data Rate (DDR) with two data transfers per DA_CLKP/N clock cycle. The data format is 7 MSBs (rising edge)/7 LSBs falling edge. In the default mode (reverse bus not enabled): D6P/N is most significant data bit (MSB) D0P/N is most significant data bit (LSB)
DB[6:0]P/N	26/27 29/30-39/40	I	LVDS positive input data bits for channel B. Each positive/negative LVDS pair has an internal 100 Ω termination resistor. Data format relative to DB_CLKP/N clock is Double Data Rate (DDR) with two data transfers per DB_CLKP/N clock cycle. The data format is 7 MSBs (rising edge)/7 LSBs falling edge. In the default mode (reverse bus not enabled): D6P/N is most significant data bit (MSB) D0P/N is most significant data bit (LSB)
DA_CLKP/N	6/7	I	DDR differential input data clock for channel A. Edge to center nominal timing.
DB_CLKP/N	24/25	I	DDR differential input data clock for channel B. Edge to center nominal timing.
OUTPUT/CLOCK			
DACCLKP/N	½	I	LVPECL clock input for DAC core with a self-bias of approximately CLKVDD18/2.
IOUTAP/N	61/60	O	A-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full scale current source and the most positive voltage on the IOUTAP pin. Similarly, a 0xFFFF data input results in a 0 mA current source and the least positive voltage on the IOUTAP pin. The IOUTAN pin is the complement of IOUTAP.
IOUTBP/N	53/54	O	B-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full scale current source and the most positive voltage on the IOUTBP pin. Similarly, a 0xFFFF data input results in a 0 mA current source and the least positive voltage on the IOUTBP pin. The IOUTBN pin is the complement of IOUTBP.
REFERENCE			
EXTIO	58	I/O	Used as external reference input when internal reference is disabled. Requires a 0.1 µF decoupling capacitor to GND when used as reference output.
BIASJ	57	O	Full-scale output current bias. For 20 mA full-scale output current, connect a 960 Ω resistor to GND.
POWER SUPPLY			
IOVDD	45	I	Supply voltage for CMOS IO's. 1.8V – 3.3V.
CLKVDD18	3	I	1.8V clock supply
DIGVDD18	21, 28	I	1.8V digital supply. Also supplies LVDS receivers.
VDDA18	50, 64	I	Analog 1.8V supply
VDDA33	55, 56, 59	I	Analog 3.3V supply
VFUSE	8	I	Digital supply voltage. (1.8V) This supply pin is also used for factory fuse programming. Connect to DVDD pins for normal operation.
NC	4, 5 51, 52 62, 63		Not used. In actual application, Pins 51, 52, 62 and 63 can be left open or tied to GROUND. It is recommended to tie Pins 4 and 5 to DIGVDD18 and GROUND , respectively.

TYPICAL CHARACTERISTICS (continued)

All plots are at 25°C, nominal supply voltages, f_{DAC} = 500MSPS, 50% clock duty cycle, 0-dBFS input signal and 20mA full-scale output current (unless otherwise noted).

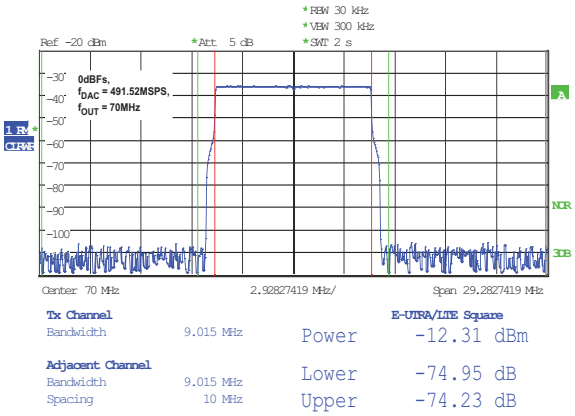

Figure 21. ACPR - LTE 10MHz FDD E-TM 1.1

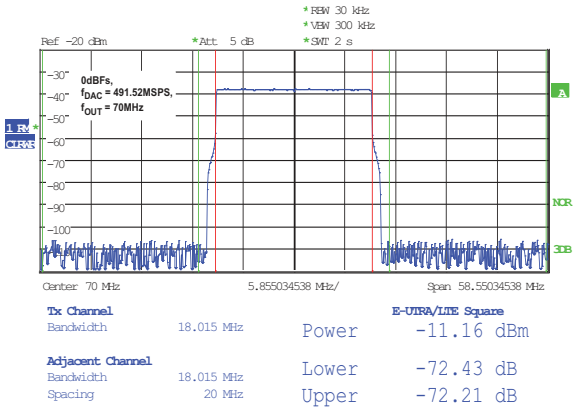

Figure 22. ACPR – LTE 20MHz FDD E-TM 1.1

DEFINITION OF SPECIFICATIONS

Adjacent Carrier Leakage Ratio (ACLR): Defined as the ratio in decibels relative to the carrier (dBc) between the measured power within a channel and that of its adjacent channel.

Analog and Digital Power Supply Rejection Ratio (APSSR, DPSSR): Defined as the percentage error in the ratio of the delta IOUT and delta supply voltage normalized with respect to the ideal IOUT current.

Differential Nonlinearity (DNL): Defined as the variation in analog output associated with an ideal 1 LSB change in the digital input code.

Gain Drift: Defined as the maximum change in gain, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

Gain Error: Defined as the percentage error (in FSR%) for the ratio between the measured full-scale output current and the ideal full-scale output current.

Integral Nonlinearity (INL): Defined as the maximum deviation of the actual analog output from the ideal output, determined by a straight line drawn from zero scale to full scale.

Intermodulation Distortion (IMD3): The two-tone IMD3 is defined as the ratio (in dBc) of the 3rd-order intermodulation distortion product to either fundamental output tone.

Offset Drift: Defined as the maximum change in DC offset, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

Offset Error: Defined as the percentage error (in FSR%) for the ratio between the measured mid-scale output current and the ideal mid-scale output current.

Output Compliance Range: Defined as the minimum and maximum allowable voltage at the output of the current-output DAC. Exceeding this limit may result reduced reliability of the device or adversely affecting distortion performance.

Reference Voltage Drift: Defined as the maximum change of the reference voltage in ppm per degree Celsius from value at ambient (25°C) to values over the full operating temperature range.

Spurious Free Dynamic Range (SFDR): Defined as the difference (in dBc) between the peak amplitude of the output signal and the peak spurious signal.

Signal to Noise Ratio (SNR): Defined as the ratio of the RMS value of the fundamental output signal to the RMS sum of all other spectral components below the Nyquist frequency, including noise, but excluding the first six harmonics and dc.

NOTE

When the register rev (config0, bit 11) is asserted, the MSB/LSB of the input bits are reversed. When using the 14-bit interface, all 14 bits are reversed as one word; when using the 7-bit interface, each 7-bit is reversed.

SERIAL INTERFACE DESCRIPTION

The serial port of the DAC3174 is a flexible serial interface which communicates with industry standard microprocessors and microcontrollers. The interface provides read/write access to all registers used to define the operating modes of DAC3174. It is compatible with most synchronous transfer formats and can be configured as a 3 or 4 pin interface by *sif4_ena* in register config 0, bit 9. In both configurations, SCLK is the serial interface input clock and SDENB is serial interface enable. For 3 pin configuration, SDIO is a bidirectional pin for both data in and data out. For 4 pin configuration, SDIO is data in only and SDO is data out only. Data is input into the device with the rising edge of SCLK. Data is output from the device on the falling edge of SCLK.

Each read/write operation is framed by signal SDENB (Serial Data Enable Bar) asserted low. The first frame byte is the instruction cycle which identifies the following data transfer cycle as read or write as well as the 7-bit address to be accessed. Table 5 indicates the function of each bit in the instruction cycle and is followed by a detailed description of each bit. The data transfer cycle consists of two bytes.

Table 5. Instruction byte of the Serial interface

	MSB							LSB
Bit	7	6	5	4	3	2	1	0
Description	R/W	A6	A5	A4	A3	A2	A1	A0

R/W — Identifies the following data transfer cycle as a read or write operation. A high indicates a read operation from DAC3174 and a low indicates a write operation to DAC3174.

[A6 : A0] — Identifies the address of the register to be accessed during the read or write operation.

Figure 27 shows the serial interface timing diagram for a DAC3174 write operation. SCLK is the serial interface clock input to DAC3174. Serial data enable SDENB is an active low input to DAC3174. SDIO is serial data in. Input data to DAC3174 is clocked on the rising edges of SCLK.

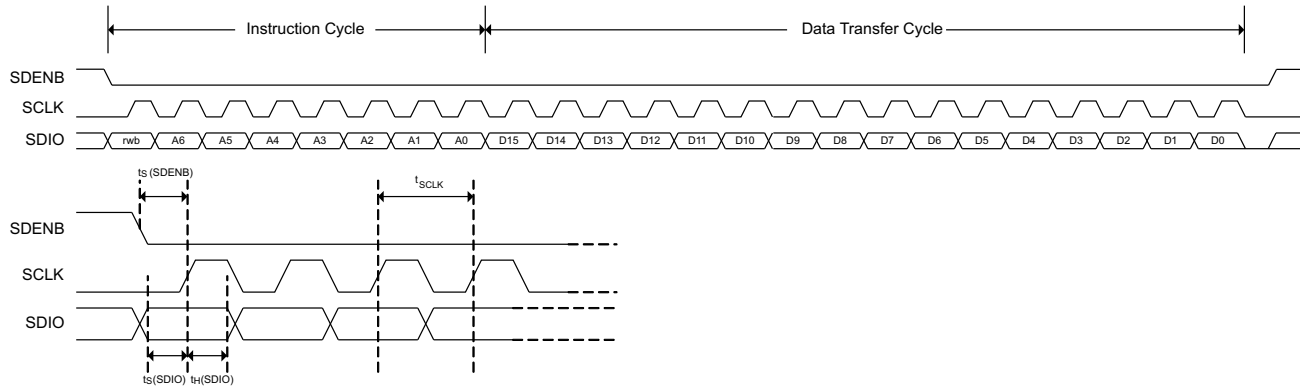

Figure 27. Serial Interface Write Timing Diagram

Figure 28 shows the serial interface timing diagram for a DAC3174 read operation. SCLK is the serial interface clock input to DAC3174. Serial data enable SDENB is an active low input to DAC3174. SDIO is serial data in during the instruction cycle. In 3 pin configuration, SDIO is data out from the DAC3174 during the data transfer cycle, while SDO is in a high-impedance state. In 4 pin configuration, both SDIO and SDO are data out from the DAC3174 during the data transfer cycle. At the end of the data transfer, SDIO and SDO will output low on the final falling edge of SCLK until the rising edge of SDENB when they will 3-state.

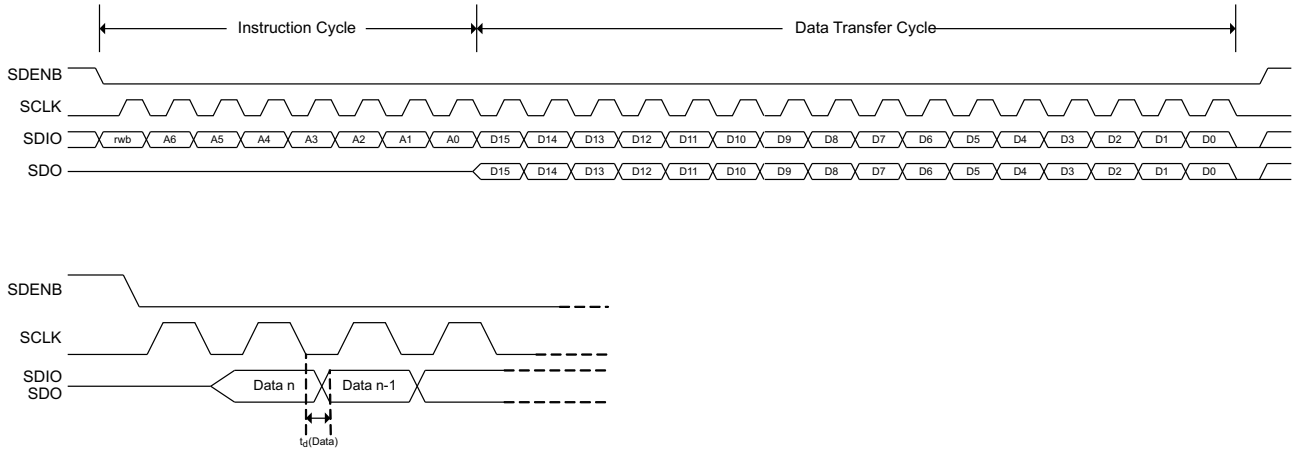

Figure 28. Serial Interface Read Timing Diagram

REGISTER DESCRIPTIONS

In the SIF interface there are four types of registers:

NORMAL: The NORMAL register type allows data to be written and read from. All 16-bits of the data are registered at the same time. There is no synchronizing with an internal clock thus all register writes are asynchronous with respect to internal clocks. There are three subtypes of NORMAL:

- **AUTOSYNC:** A NORMAL register that causes a sync to be generated after the write is finished. These are most commonly used in things like offsets and phaseadd where there is a word or block setup that extends across multiple registers and all of the registers need to be programmed before any take effect on the circuit. For example, the phaseadd is two registers long. It wouldn't serve the user to have the first write 16 of the 32 bits cause a change in the frequency, so the design allows all the registers to be written and then when that last one for this block is finished, an autosync is generated for the mixer telling it to grab all the new SIF values. This will occur on a mixer clock cycle so that no meta-stability errors occur.
- **No RESET Value:** These are NORMAL registers, but for one reason or another reset value can not be guaranteed. This could be because the register has some read_only bits or some internal logic partially controls the bit values. An example is the SIF_CONFIG6 register. The bits come from the temperature sensor and the fuses. Depending on which fuses are blown and what the die temp is the reset value will be different.
- **FUSE controlled:** While this isn't a type of register, you may see this description in the area describing the default value for the register. What is means is that fuses will change the default value and the value shown in the document is for when no fuses are blown.

READ_ONLY: Registers that are internal wires ANDed with the address bus then connected to the SIF output data bus.

WRITE_TO_CLEAR: These registers are just like NORMAL registers with one exception. They can be written and read, however, when the internal logic asynchronously sets a bit high in one of these registers, that bit stays high until it is written to '0'. This way interrupts will be captured and stay constant until cleared by the user.

Register name: config0 – Address: 0x00, Default: 0x44FC

Register Name	Addr (Hex)	Bit	Name	Function	Default Value
config0	0x00	15	qmc_offset_ena	Enable the offset function when asserted.	0
		14	dual_ena	Utilizes both DACs when asserted.	1 FUSE controlled
		13:12	chipwidth	Programmable bits for setting the input interface width. 00: all 14 bits are used. 01: upper 12 bits are used10: upper 10 bits are used 11: upper 10 bits are used	00
		11	rev	Reverses the input bits. When using the 7bit interface, this reverse each 7-bit input, however when using the 14-bit interface, all 14-bits are reversed as one word.	0
		10	twos	When asserted, this bit tells the chip to presume 2's complement data is arriving at the input. Otherwise offset binary is presumed.	1
		9	sif4_ena	When asserted the SIF interface becomes a 4 pin interface. This bit has a lower priority than the **dieid_ena** bit.	0
		8	reserved	reserved	0
		7	fifo_ena	When asserted, the FIFO is absorbing the difference between INPUT clock and DAC clock. If it is not asserted then the FIFO buffering is bypassed but the reversing of bits and handling of offset binary input is still available. **NOTE: When the FIFO is bypassed the DACCCLK and DATACLK must be aligned or there may be timing errors; and, it is not recommended for actual application use.**	1
		6	alarm_out_ena	When asserted the pin alarm becomes an output instead of a tri-stated pin.	1
		5	alarm_out_pol	This bit changes the polarity of the ALARM signal. (0=negative logic, 1=positive logic)	1
		4	alignrx_ena	When asserted the ALIGN pin receiver is powered up. **NOTE: It is recommended to clear this bit when ALIGNP/N are not used (dual bus mode, and SYNC ONLY and SIF_SYNC modes in single bus mode).**	1
		3	syncrx_ena	When asserted the SYNC pin receiver is powered up **NOTE: It is recommended to clear this bit when SYNCP/N are not used (dual bus mode, and SIF_SYNC mode in single bus mode.)**	1
		2	lvdsdataclk_ena	When asserted the DATACLK pin receiver is powered up.	1
		1	reserved	reserved	0
		0	synconly_ena	When asserted the chip is put into the SYNC ONLY mode where the SYNC ONLY pin is used as the sync input for both the front and back of the FIFO.	0

Register name: config1 – Address: 0x01, Default: 0x600E

Register Name	Addr (Hex)	Bit	Name	Function	Default Value
config1	0x01	15	iotest_ena	Turns on the io-testing circuitry when asserted. This is the circuitry that will compare a 8 sample input pattern to SIF programmed registers to make sure the data coming into the chip meets setup/hold requirements. If this bit is a '0' then the clock to this circuitry is turned off for power savings. **NOTE: Sample 0 should be aligned with the rising edge of SYNC.**	0
		14	bsideclk_ena	When asserted the input clock for the B side datapath is enabled. Otherwise the IOTEST and the FIFO on the B side of the design will not get a clock.	1
		13	fullwordinterface_ena	When asserted the input interface is changed to use the full 14-bits for each word, instead of dual 7-bit buses for two half words.	1
		12	64cnt_ena	This enables the resetting of the alarms after 64 good samples with the goal of removing unnecessary errors. For instance on a lab board, when checking the setup/hold through IO TEST, there may initially be errors, but once the test is up and running everything works. Setting this bit removes the need for a SIF write to clear the alarm register.	0
		11	dacclkgone_ena	This allows the DACCLK gone signal from the clock monitor to be used to shut the output off.	0
		10	dataclkgone_ena	This allows the DATACLK gone signal from the clock monitor to be used to shut the output off.	0
		9	collision_ena	This allows the collision alarm from the FIFO to shut the output off	0
		8	reserved	Reserved.	0
		7	daca_compliment	When asserted the output to the DACA is complimented. This allows the user of the chip to effectively change the + and – designations of the DAC output pins.	0
		6	dacb_compliment	When asserted the output to the DACB is complimented. This allows the user of the chip to effectively change the + and – designations of the DAC output pins.	0
		5	sif_sync	This is the SIF_SYNC signal. Whatever is programmed into this bit will be used as the chip sync when SIF_SYNC mode is enabled.Design is sensitive to rising edges so programming from 0->1 is when the sync pulse is generated. 1->0 has no effect.	0
		4	sif_sync_ena	When asserted enable SIF_SYNC mode.	0
		3	alarm_2away_ena	When asserted alarms from the FIFO that represent the pointers being 2 away are enabled	1
		2	alarm_1away_ena	When asserted alarms from the FIFO that represent the pointers being 1 away are enabled	1
		1	alarm_collision_ena	When asserted the collision of FIFO pointers causes an alarm to be generated	1
		0	reserved	reserved	0

		11:10	reserved	reserved	00
		9:8	reserved	reserved	00
		7	reserved	reserved	0
		6	titest_voh	A fixed '1' that can be used to test the Voh at the SIF output.	1
		5	titest_vol	A fixed '0' that can be used to test the Vol at the SIF output.	0
		4:3	vendorid	Fixed at 01	01
		2:0	versionid	Chip version	001

Synchronization Modes

There are three modes of syncing included in the DAC3174.

- **NORMAL Dual Sync –** The SYNC pin is used to align the input side of the FIFO (write pointers) with the A(0) sample. The ALIGN pin is used to reset the output side of the FIFO (read pointers) to the offset value. Multiple chip alignment can be accomplished with this kind of syncing.
- **SYNC ONLY –** In this mode only the SYNC pin is used to sync both the read and write pointers of the FIFO. There is an asynchronized handoff between the DATACLK and DACCLK when using this mode, therefore it is impossible to accurately align multiple chips closer than 2 or 3T.
- **SIF_SYNC –** When neither SYNC nor ALIGN are used, a programmable SYNC pulse can be used to sync the design. However, the same issues as SYNC ONLY apply. There is an asynchronized handoff between the serial clock domain and the two sides of the FIFO. Because of the asynchronous nature of the SIF_SYNC it is impossible to align the sync up with any sample at the input. **NOTE: SIF_SYNC mode is the only synchronization mode supported in dual bus mode**.

NOTE

When ALIGNP/N are not used, it is recommended to clear the alignrx_ena register (config1, bit 4), and tie ALIGNP to DIGVDD18 and ALIGNN to GROUND. When SYNCP/N are not used, it is recommended to clear register syncrx_ena (config0, bit3), and the unused SYNCP/N pins can be left open or tied to GROUND.

Alarm Monitoring

DAC3174 includes flexible alarm monitoring that can be used to alert a possible malfunction scenario. All alarm events can be accessed either through the SIP registers and/or through the ALARM pin. Once an alarm is set, the corresponding alarm bit in register config5 must be reset through the serial interface to allow further testing. The set of alarms includes the following conditions:

Zero check alarm

- Alarm_from_zerochk. Occurs when the FIFO write pointer has an all zeros pattern. Since the write pointer is a shift register, all zeros will cause the input point to be stuck until the next sync event. When this happens a sync to the FIFO block is required.

FIFO alarms

- alarm_from_fifo. Occurs when there is a collision in the FIFO pointers or a collision event is close.
- alarm_fifo_2away. Pointers are within two addresses of each other.
- alarm_fifo_1away. Pointers are within one address of each other.
- alarm_fifo_collision. Pointers are equal to each other.

Clock alarms

- clock_gone. Occurs when either the DACCLK or DATACLOCK have been stopped.
- alarm_dacclk_gone. Occurs when the DACCLK has been stopped.
- alarm_dataclk_gone. Occurs when the DATACLK has been stopped.

Pattern checker alarm

- alarm_from_iotest. Occurs when the input data pattern does not match the pattern key.

To prevent unexpected DAC outputs from propagating into the transmit channel chain, DAC3174 includes a feature that disables the outputs when a catastrophic alarm occurs. The catastrophic alarms include FIFO pointer collision, the loss DACCLK or the loss of DATACLK. When any of these alarms occur the internal TXenable signal is driven low, causing a zeroing of the data going to the DAC in <10T. One caveat is if both clocks stop, the circuit cannot determine clock loss so no alarms are generated; therefore, no zeroing of output data occurs.

REVISION HISTORY

Changes from Original (April 2013) to Revision A	Page
• Deleted PRODUCT PREVIEW banner for device release	1

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC3174IRGCR	ACTIVE	VQFN	RGC	64	2000	Green (RoHS & no Sb/Br)	NIPDAU	Level-3-260C-168 HR	-40 to 85	DAC3174I	Samples
DAC3174IRGCT	ACTIVE	VQFN	RGC	64	250	Green (RoHS & no Sb/Br)	NIPDAU	Level-3-260C-168 HR	-40 to 85	DAC3174I	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

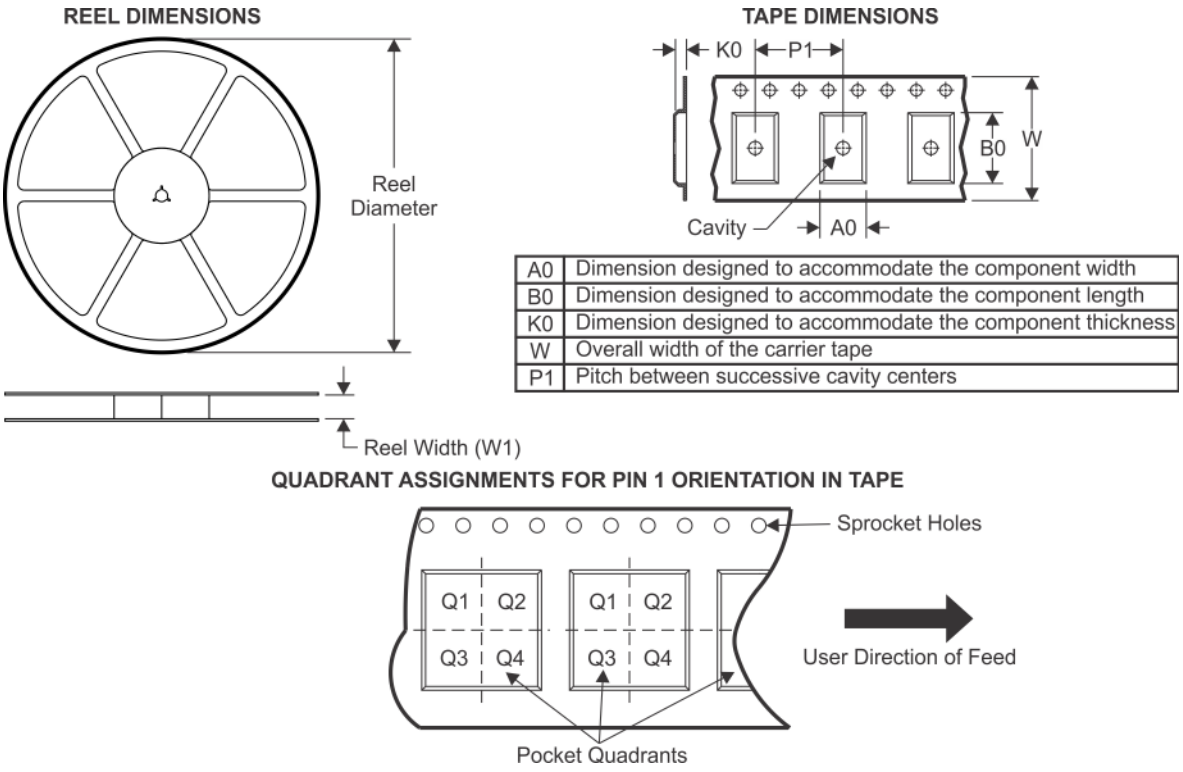
(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION

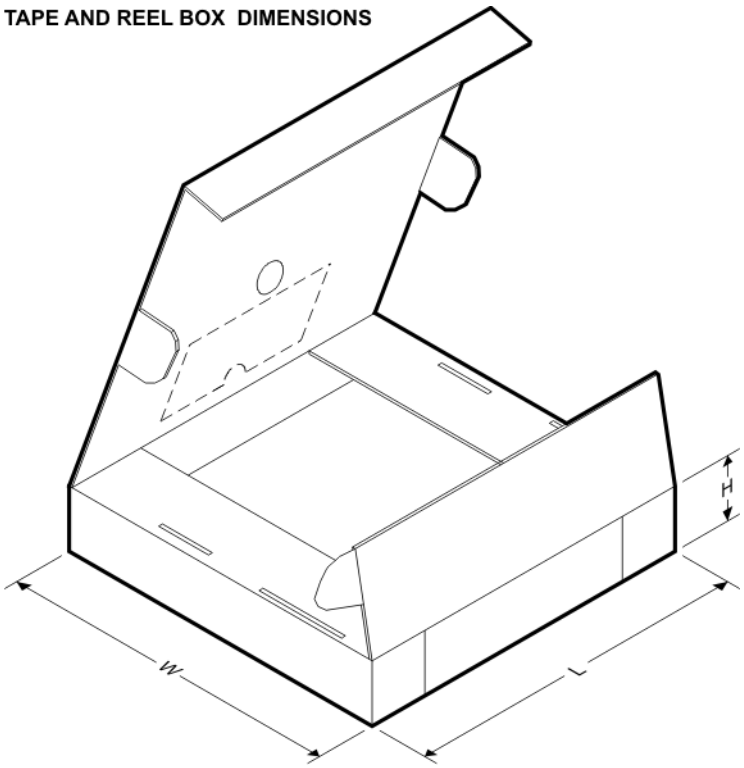


A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
DAC3174IRGCR	VQFN	RGC	64	2000	330.0	16.4	9.3	9.3	1.5	12.0	16.0	Q2
DAC3174IRGCT	VQFN	RGC	64	250	330.0	16.4	9.3	9.3	1.5	12.0	16.0	Q2

TAPE AND REEL BOX DIMENSIONS



*All dimensions are nominal

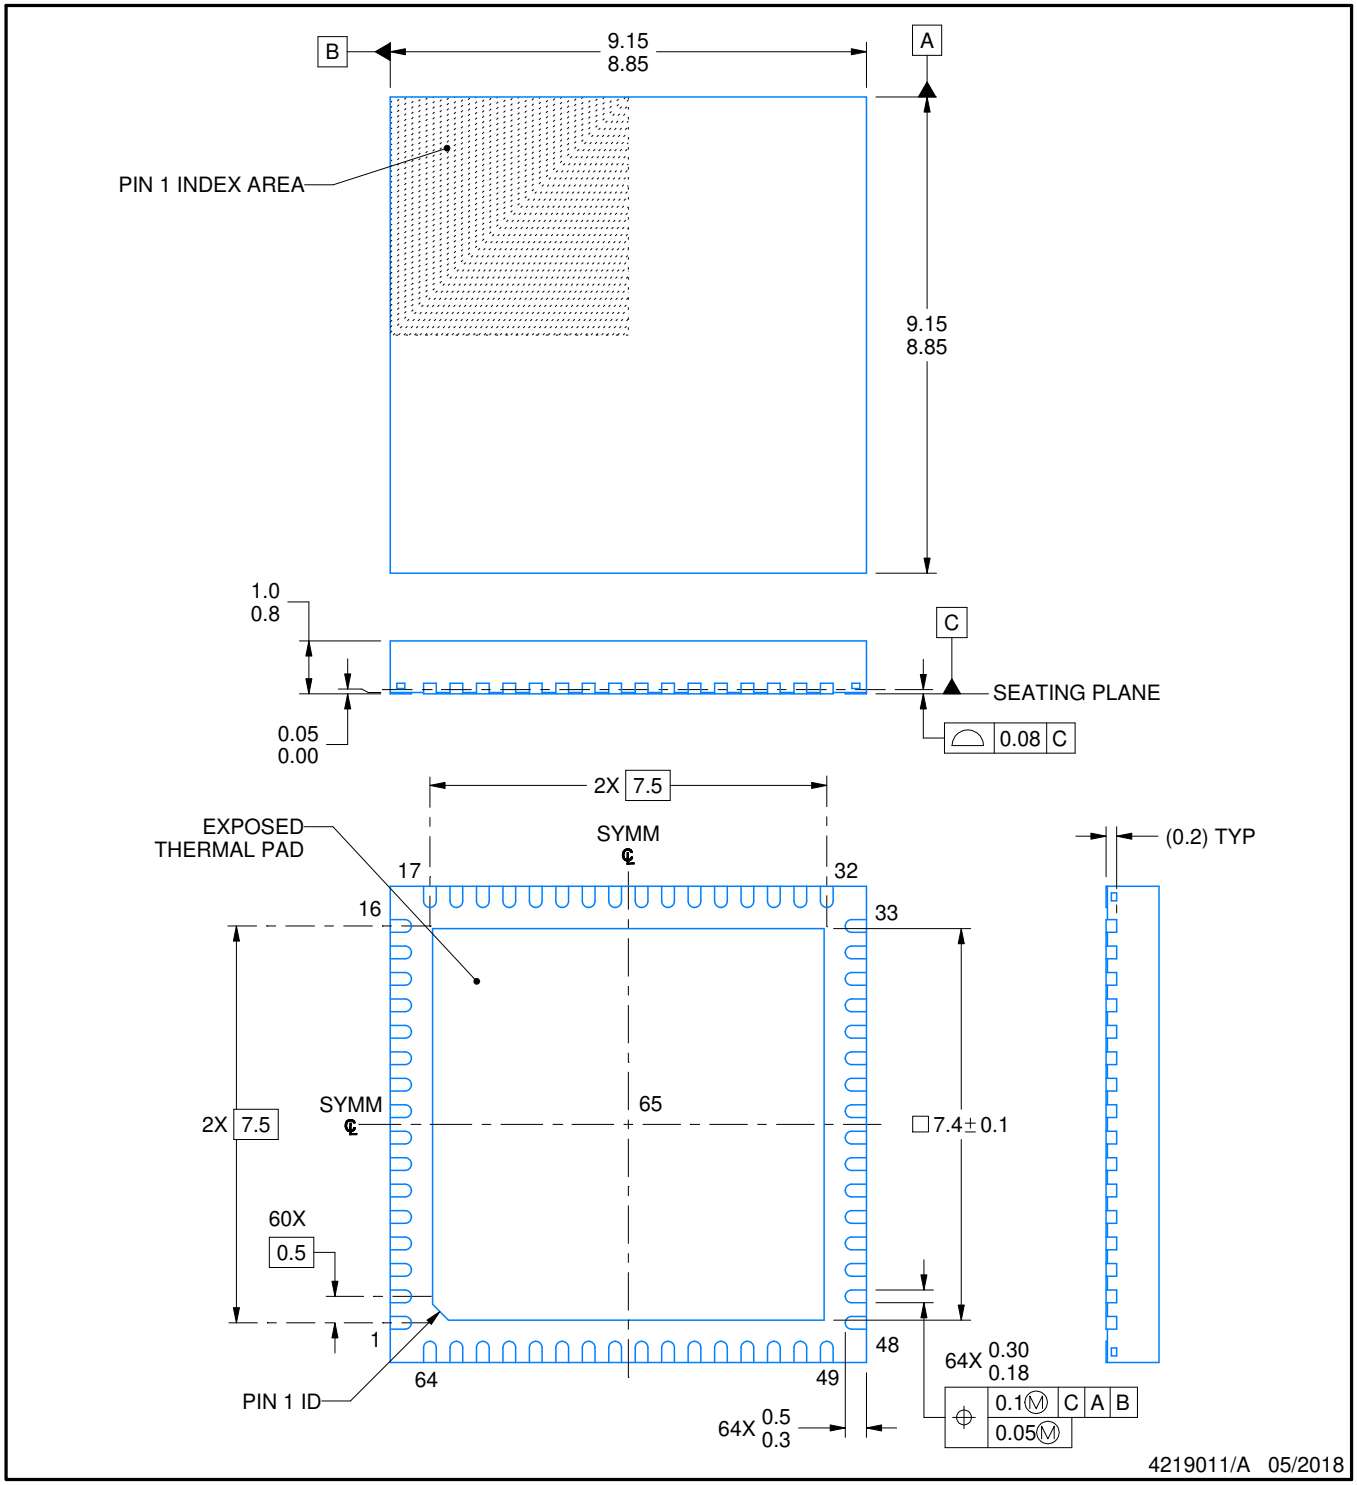
PACKAGE OUTLINE

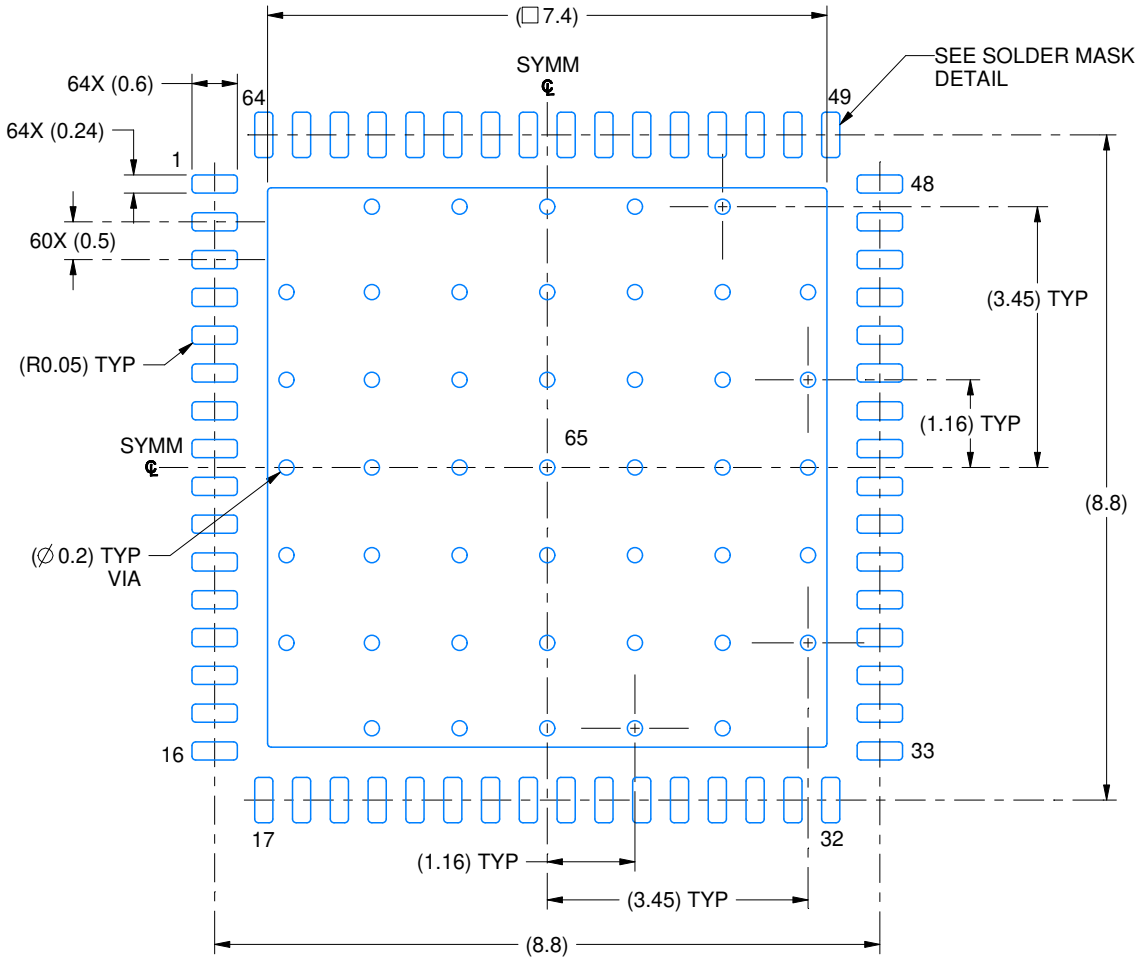
VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

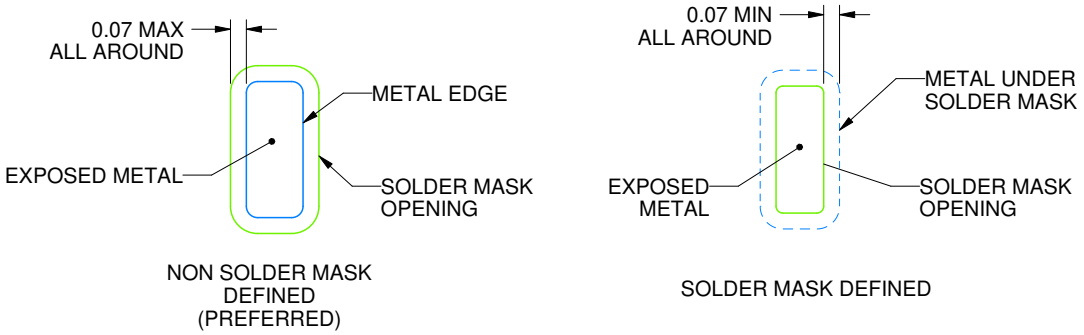


NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 10X

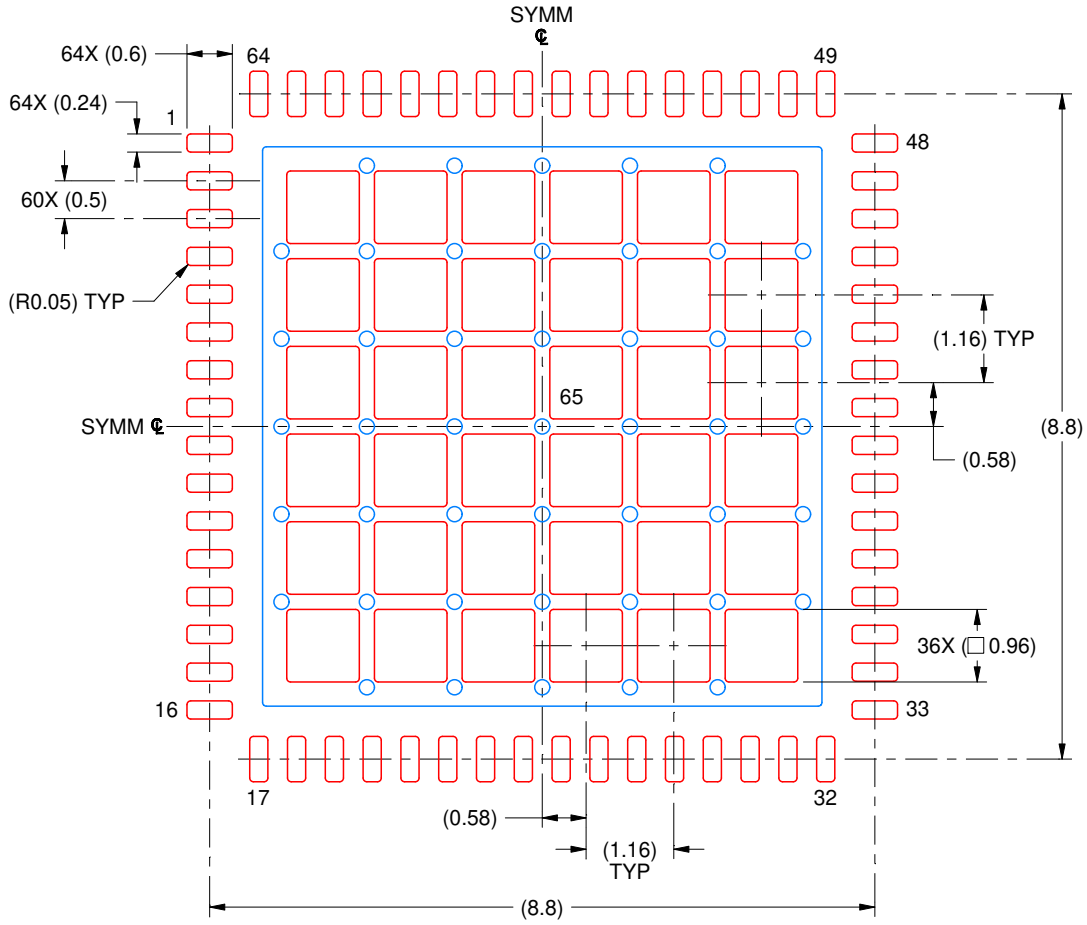


SOLDER MASK DETAILS

4219011/A 05/2018

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.



SOLDER PASTE EXAMPLE
BASED ON 0.125 MM THICK STENCIL
SCALE: 10X

EXPOSED PAD 65
61% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE

4219011/A 05/2018

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
