## description

The 320C67x™ DSPs (including the SM320C6712-EP, SM320C6712C-EP, SM320C6712D-EP devices†) are members of the floating-point DSP family in the TMS320C6000™ DSP platform. The C6712, C6712C, and C6712D devices are based on the high-performance, advanced very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunction applications.

With performance of up to 1000 million floating-point operations per second (MFLOPS) at a clock rate of 167 MHz, the C6712C/C6712D device is the lowest-cost DSP in the C6000™ DSP platform. The C6712C/C6712D DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide four floating-/fixed-point ALUs, two fixed-point ALUs, and two floating-/fixed-point multipliers. The C6712C/C6712D can produce two MACs per cycle for a total of 300 MMACS.

With performance of up to 600 million floating-point operations per second (MFLOPS) at a clock rate of 100 MHz, the C6712 device also offers cost-effective solutions to high-performance DSP programming challenges. The C6712 DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide four floating-/fixed-point ALUs, two fixed-point ALUs, and two floating-/fixed-point multipliers. The C6712 can produce two multiply-accumulates (MACs) per cycle for a total of 200 million MACs per second (MMACS).

The C6712/C6712C/C6712D uses a two-level cache-based architecture and has a powerful and diverse set of peripherals. The Level 1 program cache (L1P) is a 32-Kbit direct mapped cache and the Level 1 data cache (L1D) is a 32-Kbit 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 512-Kbit memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or combinations of the two. The peripheral set includes two multichannel buffered serial ports (McBSPs), two general-purpose timers, and a glueless 16-bit external memory interface (EMIF) capable of interfacing to SDRAM, SBSRAM, and asynchronous peripherals. The C6712C device also includes a dedicated general-purpose input/output (GPIO) peripheral module.

The C6712/C6712C/C6712D DSPs also have application-specific hardware logic, on-chip memory, and additional on-chip peripherals.

The C6712/C6712C/C6712D has a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

## device characteristics

Table 1 provides an overview of the C6712/C6712C/C6712D DSPs. The table shows significant features of each device, including the capacity of on-chip RAM, the peripherals, the execution time, and the package type with pin count. For more details on the C6000™ DSP device part numbers and part numbering, see Table 17 and Figure 5.

**Table 1. Characteristics of the C6712, C6712C, and C6712D Processors**

HARDWARE FEATURES		INTERNAL CLOCK SOURCE	C6712 (FLOATING-POINT DSP)	C6712C/C6712D (FLOATING-POINT DSPs)

## device compatibility

The 320C6712 and C6211/C6711 devices are pin-compatible; thus, making new system designs easier and providing faster time to market. The following list summarizes the device characteristic differences among the C6211, C6211B, C6711, C6711B, C6711C, C6711D, C6712, C6712C, and C6712D devices:

- The C6211 and C6211B devices have a fixed-point TMS320C62x™ DSP core (CPU), while the C6711, C6711B, C6711C, C6711D, C6712, C6712C, and C6712D devices have a floating-point C67x™ CPU.
- The C6211, C6211B, C6711, C6711B, C6711C, and C6711D devices have a 32-bit EMIF, while the C6712, C6712C, and C6712D devices have a 16-bit EMIF.
- The C6211, C6211B, C6711, C6711B, C6711C, and C6711D devices feature an HPI, while the C6712, C6712C, and C6712D devices do not.
- The C6712, C6712C, and C6712D devices have dedicated device configuration pins, BOOTMODE, LENDIAN, and EMIFBE (12D only) that specify the boot-load operation and device endianness, respectively, during reset. On the C6211/C6211B and C6711/C6711B/C6711C/C6711D devices, these configuration pins are integrated with the HPI pins.
- The C6211/C6211B device runs at -167 and -150 MHz clock speeds (with a C6211BGFNA extended temperature device that also runs at -150 MHz), while the C6711/C6711B device runs at -150 and -100 MHz (with a C6711BGFNA extended temperature device that also runs at -100 MHz) and the C6711C/C6711D device runs at -200 clock speed (with a C6711CGDPA extended temperature device that also runs at -167 MHz). The C6712 device runs at -100 MHz clock speed and the C6712C/C6712D device runs at -167 MHz clock speed.
- The C6211/C6211B, C6711-100, C6711B and C6712 devices have a core voltage of 1.8 V, the C6711-150 device has a core voltage is 1.9 V, and the C6711C/C6711D and C6712C/C6712D devices operate with a core voltage of 1.20† V.
- There are several enhancements and features that are only available on the C6711C/C6711D and C6712C/C6712D devices, such as: the CLKOUT3 signal, a software-programmable PLL and PLL Controller, and a GPIO peripheral module. The C6711D and C6712D devices also have additional enhancements such as: EMIF Big Endian mode correctness EMIFBE and the L1D requestor priority to L2 bit [“P” bit] in the cache configuration (CCFG) register. C6712D supports Big Endian mode.
- The C6712/C6712C/C6712D is the lowest-cost entry in the TMS320C6000™ platform.

For a more detailed discussion on the similarities/differences among the C6211, C6711, and C6712 devices, see the *How to Begin Development Today with the TMS320C6211 DSP*, *How to Begin Development with the TMS320C6711 DSP*, and *How to Begin Development With the TMS320C6712 DSP* application reports (literature number SPRA474, SPRA522, and SPRA693, respectively).

For a more detailed discussion on the migration of a C6211, C6211B, C6711, or C6711B device to a TMS320C6711C device, see the *Migrating from TMS320C6211(B)/6711(B) to TMS320C6711C* application report (literature number SPRA837).

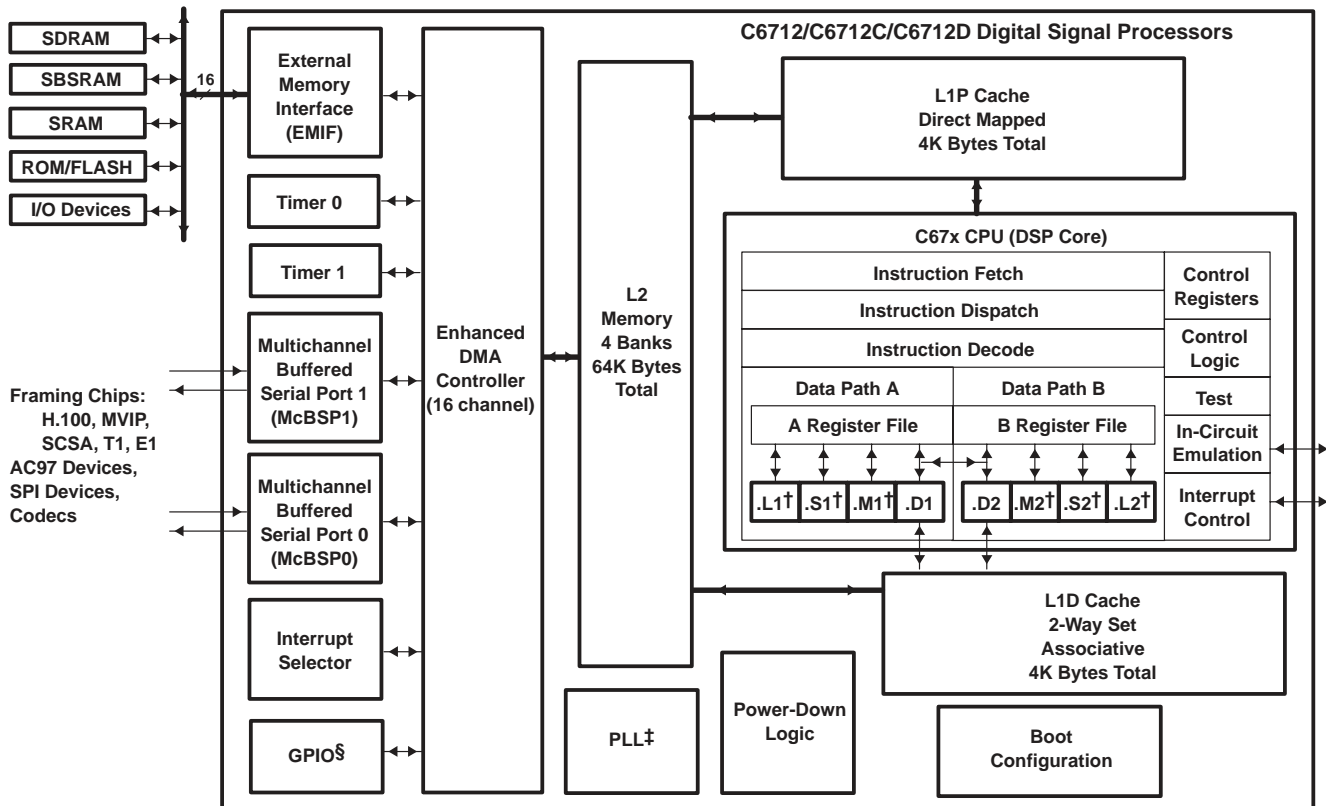

For a more detailed discussion on the migration of a C6712 device to a TMS320C6712C device, see the *Migrating from TMS320C6712 to TMS320C6712C* application report (literature number SPRA852).

## CPU (DSP core) description

The CPU fetches advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C67x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see the functional block and CPU (DSP Core) diagram and Figure 1]. The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

The C67x CPU executes all C62x™ DSP instructions. In addition to C62x™ fixed-point DSP instructions, the six out of eight functional units (.L1, .M1, .D1, .D2, .M2, and .L2) also execute floating-point instructions. The remaining two functional units (.S1 and .S2) also execute the new LDDW instruction which loads 64 bits per CPU side for a total of 128 bits per cycle.

Another key feature of the C67x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C67x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically “true”). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

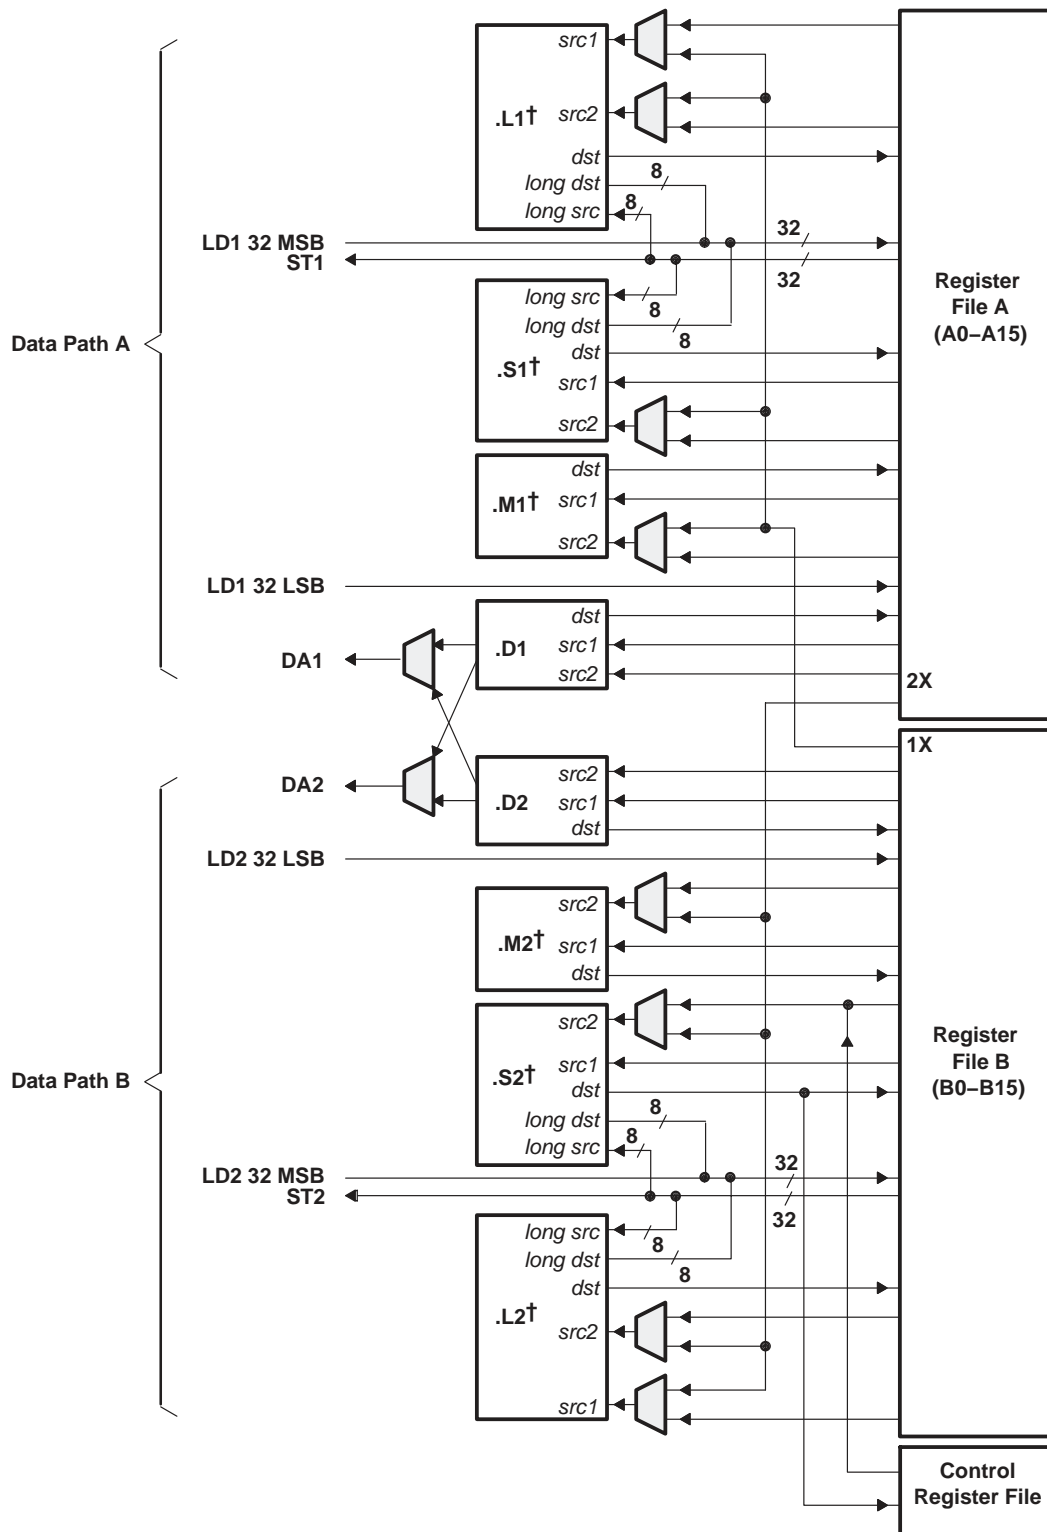

---

C62x is a trademark of Texas Instruments.

CPU (DSP core) description (continued)

† In addition to fixed-point instructions, these functional units execute floating-point instructions.

## memory map summary

Table 2 shows the memory map address ranges of the C6712/C6712C/C6712D devices. Internal memory is always located at address 0 and can be used as both program and data memory. The C6712/C6712C/C6712D configuration registers for the common peripherals are located at the same hex address ranges. The external memory address ranges in the C6712/C6712C/C6712D devices begin at the address location 0x8000 0000.

**Table 2. 320C6712/C6712C/C6712D Memory Map Summary**

MEMORY BLOCK DESCRIPTION	BLOCK SIZE (BYTES)	HEX ADDRESS RANGE
Internal RAM (L2)	64K	0000 0000 – 0000 FFFF
Reserved	24M – 64K	0001 0000 – 017F FFFF
External Memory Interface (EMIF) Registers	256K	0180 0000 – 0183 FFFF

SGUS055 – SEPTEMBER 2004

## signal groups description

† The CLKOUT3 and PLLHV pin functions are applicable to the C6712C/12D device only.

‡ For the C6712C/12D device, the CLKOUT2 pin is multiplexed with the GP[2] pin. Default function is CLKOUT2. To use this pin as GPIO, the GP2EN bit in the GPEN register and the GP2DIR bit in the GPDIR register must be properly configured.

§ The CLKOUT1 pin function is applicable to the C6712 device only.

¶ These pins apply to the C6712 device only. The C6712C/12D device has a different PLL module and PLL Controller; therefore, the PLLV, PLLG, and PLLF pins are not necessary on the C6712C device.

# For the C6712C/12D device, the external interrupts (EXT\_INT[7-4]) go through the general-purpose input/output (GPIO) module. When used as interrupt inputs, the GP[7-4] pins must be configured as inputs (via the GPDIR register) and enabled (via the GPEN register) in addition to enabling the interrupts in the interrupt enable register (IER).

|| This pin functions as the Big Endian mode correctness and is used when Big Endian mode is selected (LENDIAN = 0) [C6712D]

Figure 3. CPU (DSP Core) and Peripheral Signals

signal groups description (continued)

† For proper C6712C/C6712D device operation, these pins must be externally pulled up with a 10-k $\Omega$  resistor.  
 ‡ Only the C6712C/C6712D device supports the general-purpose input/output (GPIO) port peripheral.

SGUS055 – SEPTEMBER 2004

## DEVICE CONFIGURATIONS

On the C6712, C6712C, and C6712D devices, bootmode and certain device configurations/peripheral selections are determined at device reset. For the C6712C/C6712D devices only, other device configurations (e.g., EMIF input clock source) are software-configurable via the device configurations register (DEVCFG) [address location 0x019C0200] after device reset.

### device configurations at device reset

Table 14 describes the C6712/12C/12D device configuration pins, which are set up via internal or external pullup/pulldown resistors through the LENDIAN,  $\overline{\text{EMIFBE}}$  [12D only], BOOTMODE[1:0], and CLKMODE0 pins. These configuration pins must be in the desired state until reset is released. For more details on these device configuration pins, see the Terminal Functions table of this data sheet.

**Table 14. Device Configurations Pins at Device Reset  
(LENDIAN,  $\overline{\text{EMIFBE}}$  [12D only], BOOTMODE[1:0], and CLKMODE0)**

CONFIGURATION PIN	GFN and GDP	FUNCTIONAL DESCRIPTION
$\overline{\text{EMIFBE}}$	C15	<p>EMIF Big Endian mode correctness (<math>\overline{\text{EMIFBE}}</math>) [C6712D only] C15 – “Reserved” pin for C6712/C6712C devices, the C6712/C6712C devices do <i>not</i> support Big Endian mode.</p> <p>When Big Endian mode is selected (LENDIAN = 0), for proper C6712D device operation the <math>\overline{\text{EMIFBE}}</math> pin <i>must</i> be externally pulled low.</p> <p>This enhancement is <i>not</i> supported on the C6712/12C devices. For proper C6712/C6712C device operation, this pin is “Reserved and <i>must</i> be externally pulled <b>high</b> with a 10-k<math>\Omega</math> resistor”.</p> <p>This new functionality does <i>not</i> affect systems using the current default value of C15 pin=1. For more detailed information on the Big Endian mode correctness, see the <i>EMIF Big Endian Mode Correctness [C6712D Only]</i> portion of this data sheet.</p>
LENDIAN	B17	<p>Device Endian mode (LEND)</p> <ul style="list-style-type: none"> <li>0 – System operates in Big Endian mode. SGUS055 – SEPTEMBER 2004

## Terminal Functions

SIGNAL NAME	PIN NO.		TYPE†	IPD/ IPU‡	DESCRIPTION
	GFN	GDP			
<b>CLOCK/PLL</b>					
CLKIN	A3	A3	I	IPU	Clock Input
CLKOUT1	D7	—	O	IPD	Clock output at device speed [C6712 only] The CLK1EN bit in the EMIF GBLCTL register controls the CLKOUT1 pin. CLK1EN = 0: CLKOUT1 is disabled CLK1EN = 1: CLKOUT1 enabled to clock [default]
CLKOUT2	Y12	Y12	O/Z	IPD	Clock output at half of device speed [C6712 only]  For the C6712C/12D device, the CLKOUT2 pin is multiplexed with the GP[2] pin. Clock output at half of device speed ( <b>O/Z</b> ) [default] (SYSCLK2 internal signal from the clock generator) or this pin can be programmed as GP[2] (I/O/Z).  When the CLKOUT2 pin is enabled, the CLK2EN bit in the EMIF global control register (GBLCTL) controls the CLKOUT2 pin (All devices). CLK2EN = 0: CLKOUT2 is disabled CLK2EN = 1: CLKOUT2 enabled to clock [default]
CLKOUT3	—	D10	O	IPD	Clock output programmable by OSCDIV1 register in the PLL controller. [12C/12D]
CLKMODE0	C4	C4	I	IPU	Clock mode select [C6712] 0 – Bypass mode (x1). CPU clock = CLKIN 1 – PLL mode (x4). CPU clock = 4 x CLKIN [default]  Clock generator input clock source select [C6712C/12D] 0 – Reserved. Do not use. 1 – CLKIN square wave [default]  For proper C6712C/12D device operation, this pin must be either left unconnected or externally pulled up with a 1-k $\Omega$ resistor.
PLLVS§	A4	—	A¶		PLL analog V <sub>CC</sub> connection for the low-pass filter [C6712 only]
PLLGS§	C6	—	A¶		PLL analog GND connection for the low-pass filter [C6712 only]
PLLF	B5	—	A¶		PLL low-pass filter connection to external components and a bypass capacitor [C6712 only]
PLLHV	—	C5	A¶		Analog power (3.3 V) for PLL [C6712C/C6712D only]
<b>JTAG EMULATION</b>					
TMS	B7	B7	I	IPU	JTAG test-port mode select
TDO	A8	A8	O/Z	IPU	JTAG test-port data out
TDI	A7	A7	I	IPU	JTAG test-port data in
TCK	A6	A6	I	IPU	JTAG test-port clock
TRST	B6	B6	I	IPD	JTAG test-port reset. For IEEE 1149.1 JTAG compatibility, see the <i>IEEE 1149.1 JTAG Compatibility Statement</i> section of this data sheet.
EMU5	B12	B12	I/O/Z	IPU	Emulation pin 5. Reserved for future use, leave unconnected.
EMU4	C11	C11	I/O/Z	IPU	Emulation pin 4. Reserved for future use, leave unconnected.
EMU3	B10	B10	I/O/Z	IPU	Emulation pin 3. Reserved for future use, leave unconnected.
EMU2	D10	D3	I/O/Z	IPU	Emulation pin 2. Reserved for future use, leave unconnected.

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ For **C6712**, IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-k $\Omega$  IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-k $\Omega$  resistor should be used.)

For **C6712C/12D**, IPD = Internal pulldown, IPU = Internal pullup. [These IPD/IPU signal pins feature a 13-k $\Omega$  resistor (approximate) for the IPD or 18-k $\Omega$  resistor (approximate) for the IPU. An external pullup or pulldown resistor no greater than 4.4 k $\Omega$  and 2.0 k $\Omega$ , respectively, should be used to pull a signal to the opposite supply rail.]

§ PLLV and PLLG are not part of external voltage supply or ground. See the *clock/PLL* section for information on how to connect these pins.

	GFN	GDP			
<b>RESETS AND INTERRUPTS</b>					
$\overline{\text{RESET}}$	A13	A13	I	IPU	Device reset. When using Boundary Scan mode on the C6712C/C6712D device, drive the EMU[1:0] and RESET pins low. For the C6712D device, this pin does <i>not</i> have an IPU.
NMI	C13	C13	I	IPD	Nonmaskable interrupt • Edge-driven (rising edge) Any noise on the NMI pin may trigger an NMI interrupt; therefore, if the NMI pin is not used, it is recommended that the NMI pin be grounded versus relying on the IPD.
EXT_INT7	E3	E3	I	IPU	External interrupts [ <b>C6712</b> ] • Edge-driven • Polarity independently selected via the External Interrupt Polarity Register bits (EXTPOL.[3:0])  General-purpose input/output pins ( <b>I/O/Z</b> ) which also function as external interrupts (default) [ <b>C6712C/C6712D only</b> ] • Edge-driven • Polarity independently selected via the External Interrupt Polarity Register bits (EXTPOL.[3:0]), in addition to the GPIO registers.
EXT_INT6	D2	D2			
EXT_INT5	C1	C1			
EXT_INT4	C2	C2			
<b>EMIF – CONTROL SIGNALS COMMON TO ALL TYPES OF MEMORY#</b>					
$\overline{\text{CE3}}$	V6	V6	O/Z	IPU	Memory space enables • Enabled by bits 28 through 31 of the word address • Only one asserted during any external data access
$\overline{\text{CE2}}$	W6	W6	O/Z	IPU	
$\overline{\text{CE1}}$	W18	W18	O/Z	IPU	
$\overline{\text{CE0}}$	V17	V17	O/Z	IPU	
$\overline{\text{BE1}}$	U19	U19	O/Z	IPU	Byte-enable control • Decoded from the two lowest bits of the internal address • Byte-write enables for most types of memory • Can be directly connected to SDRAM read and write mask signal (SDQM)
$\overline{\text{BE0}}$	V20	V20	O/Z	IPU	
<b>EMIF – BUS ARBITRATION#W</b>					
$\overline{\text{HOLDA}}$	J18	J18	O	IPU	Hold-request-acknowledge to the host
$\overline{\text{HOLD}}$	J17	J17	I	IPU	Hold request from the host
BUSREQ	J19	J19	O	IPU	Bus request output
<b>EMIF – ASYNCHRONOUS/SYNCHRONOUS DRAM/SYNCHRONOUS BURST SRAM MEMORY CONTROL#</b>					
ECLKIN	Y11	Y11	I	IPD	EMIF input clock
ECLKOUT	Y10	Y10	O	IPD	EMIF output clock (based on ECLKIN) [C6712]  EMIF output clock depends on the EKSRC bit (DEVCFG.[4]) and on EKEN bit (GBLCTL.[5]). [C6712C/C6712D only] EKSRC = 0 – ECLKOUT is based on the internal SYSCLK3 signal from the clock generator (default). EKSRC = 1 – ECLKOUT is based on the the external EMIF input clock source pin (ECLKIN)  EKEN = 0 – ECLKOUT held low EKEN = 1 – ECLKOUT enabled to clock (default)

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ For **C6712**, IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

For **C6712C/12D**, IPD = Internal pulldown, IPU = Internal pullup. [These IPD/IPU signal pins feature a 13-kΩ resistor (approximate) for the IPD or 18-kΩ resistor (approximate) for the IPU. An external pullup or pulldown resistor no greater than 4.4 kΩ and 2.0 kΩ, respectively, should be used to pull a signal to the opposite supply rail.]

# To maintain signal integrity for the EMIF signals, serial termination resistors should be inserted into all EMIF output signal lines.

## **development support**

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

### **Software Development Tools:**

Code Composer Studio™ Integrated Development Environment (IDE): including Editor  
C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

### **Hardware Development Tools:**

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)  
EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

## device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ DSP devices and support tools. Each TMS320™ DSP commercial family member has one of three prefixes: SMX, TMP, or SM. Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (SMX/TMDX) through fully qualified production devices/tools (SM/TMDS).

Device development evolutionary flow:

- SMX** Preproduction device that is not necessarily representative of the final device's electrical specifications
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
- SM** Fully qualified production device

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product

SMX and TMP devices and TMDX development-support tools are shipped with appropriate disclaimers describing their limitations and intended uses. Preproduction devices (SMX) may not be representative of a final product and Texas Instruments reserves the right to change or discontinue these products without notice.

SM devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that preproduction devices (SMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GDP), the temperature range (for example, blank is the default commercial temperature range and A is the extended temperature range), and the device speed range in megahertz (for example, 16 is 167 MHz).

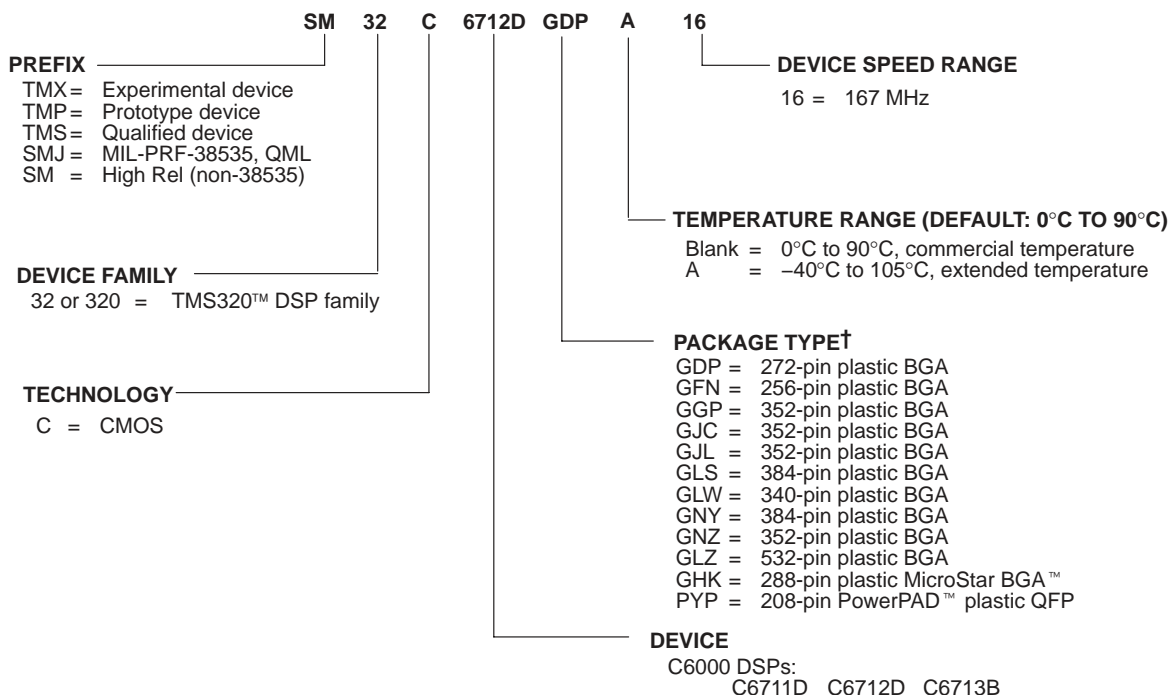

Table 17 identifies the C6712/12C/12D device part numbers (orderables). For more details and for ordering information, see the TI website ([www.ti.com](http://www.ti.com)). Figure 5 provides a legend for reading the complete device name for any member of the TMS320C6000™ DSP platform.

## documentation support

Extensive documentation supports all TMS320™ DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ DSP core (CPU) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* [hereafter referred to as the C6000 PRG Overview] (literature number SPRU190) provides an overview and briefly describes the functionality of the peripherals available on the C6000™ DSP platform of devices. This document also includes a table listing the peripherals available on the C6000 devices along with literature numbers and hyperlinks to the associated peripheral documents. These C6712C/C6712D peripherals, except the PLL, are similar to the peripherals on the TMS320C6712 and TMS320C64x devices; therefore, see the TMS320C6712 (C6711 or C67x) peripheral information, and in some cases, where indicated, see the TMS320C6712 (C6712 or TMS320C67x™ or C671x or C67x) peripheral information, and in some cases, where indicated, see the C64x information in the TMS320C6000 DSP Peripherals Overview Reference Guide (literature number SPRU190).

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the C62x™/C67x™ DSP devices, associated development tools, and third-party support.

*TMS320C6000 DSP Software-Programmable Phase-Locked Loop (PLL) Controller Reference Guide* (literature number SPRU233) describes the functionality of the PLL peripheral available on the C6712C/12D device.

The *Migrating from TMS320C6211(B)/6711(B) to TMS320C6711C* application report (literature number SPRA837) describes the differences and issues of interest related to migration from the Texas Instruments TMS320C6211, TMS320C6211B, TMS320C6711, and TMS320C6711B devices, GFN packages, to the TMS320C6711C device, GDP package.

The *Migrating from TMS320C6712 to TMS320C6712C* application report (literature number SPRA852) describes the differences and issues of interest related to migration from the Texas Instruments TMS320C6712 device, GFN package, to the TMS320C6712C device, GDP package.

The *TMS320C6712, TMS320C6712C, TMS320C6712D Digital Signal Processors Silicon Errata (C6712 Silicon Revisions 1.0, 1.2, 1.3, C6712C Silicon Revision 1.1, and C6712D Silicon Revision 2.0)* [literature number SPRZ182C or later] categorizes and describes the known exceptions to the functional specifications and usage notes for the TMS320C6712, TMS320C6712C, TMS320C6712D DSP devices.

The *TMS320C6713/12C/11C Power Consumption Summary* application report (literature number SPRA889) discusses the power consumption for user applications with the TMS320C6713, TMS320C6712C, and TMS320C6711C DSP devices.

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of C6000™ DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

See the Worldwide Web URL for the application report *How To Begin Development with the TMS320C6712 DSP* (literature number SPRA693), which describes in more detail the compatibility and similarities/differences between the C6711 and C6712 devices.

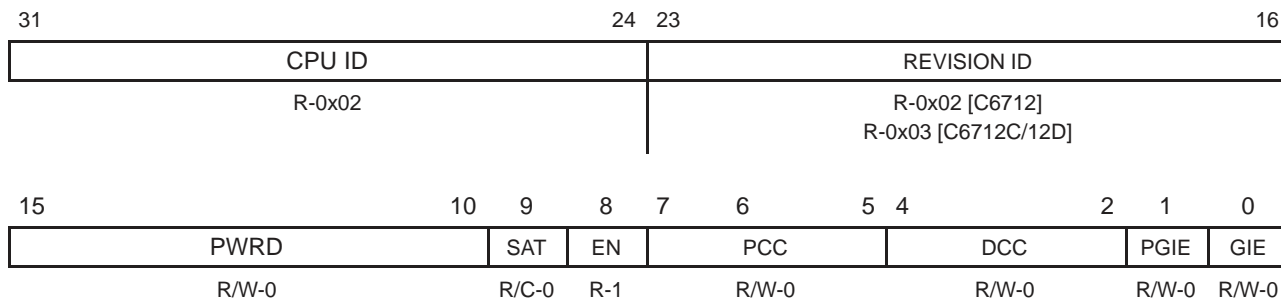

**CPU CSR register description**

The CPU control status register (CSR) contains the CPU ID and CPU Revision ID (bits 16–31) as well as the status of the device power-down modes [PWRD field (bits 15–10)], program and data cache control modes, the endian bit (EN, bit 8) and the global interrupt enable (GIE, bit 0) and previous GIE (PGIE, bit 1). Figure 6 and Table 18 identify the bit fields in the CPU CSR register.

For more detailed information on the bit fields in the CPU CSR register, see the *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) and the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

**Legend:** R = Readable by the MVC instruction, R/W = Readable/Writeable by the MVC instruction; W = Read/write; -n = value after reset, -x = undefined value after reset, C = Clearable by the MVC instruction

**Figure 6. CPU Control Status Register (CPU CSR)**

SGUS055 – SEPTEMBER 2004

## CPU CSR register description (continued)

**Table 18. CPU CSR Register Bit Field Description**

BIT #	NAME	DESCRIPTION
31:24	CPU ID	CPU ID + REV ID. Read only. Identifies which CPU is used and defines the silicon revision of the CPU.
23:16	REVISION ID	CPU ID + REVISION ID (31:16) are combined for a value of: <b>0x0202</b> for C6712 and <b>0x0203</b> for C6712C/C6712D
15:10	PWRD	Control power-down modes. The values are always read as zero.  000000 = no power-down (default) 001001 = PD1, wake-up by an enabled interrupt 010001 = PD1, wake-up by an enabled or not enabled interrupt 011010 = PD2, wake-up by a device reset 011100 = PD3, wake-up by a device reset Others = Reserved
9	SAT	Saturate bit. Set when any unit performs a saturate. This bit can be cleared only by the MVC instruction and can be set only by a functional unit. The set by the a functional unit has priority over a clear (by the MVC instruction) if they occur on the same cycle. The saturate bit is set one full cycle (one delay slot) after a saturate occurs. This bit will not be modified by a conditional instruction whose condition is false.
8	EN	Endian bit. This bit is read-only. Depicts the device endian mode. 0 = Big Endian mode. 1 = Little Endian mode [default].
7:5	PCC	Program Cache control mode. L1D, Level 1 Program Cache 000/010 = Cache Enabled / Cache accessed and updated on reads. All other PCC values reserved.
4:2	DCC	Data Cache control mode. L1D, Level 1 Data Cache 000/010 = Cache Enabled / 2-Way Cache All other DCC values reserved
1	PGIE	Previous GIE (global interrupt enable); saves the Global Interrupt Enable (GIE) when an interrupt is taken. Allows for proper nesting of interrupts.  0 = Previous GIE value is 0. (default) 1 = Previous GIE value is 1.
0	GIE	Global interrupt enable bit. Enables (1) or disables (0) all interrupts except the reset interrupt and NMI (nonmaskable interrupt).  0 = Disables all interrupts (except the reset interrupt and NMI) [default] 1 = Enables all interrupts (except the reset interrupt and NMI)

**cache configuration (CCFG) register description (12D)**

The C6712D device includes an enhancement to the cache configuration (CCFG) register. A “P” bit (CCFG.31) allows the programmer to select the priority of accesses to L2 memory originating from the transfer crossbar (TC) over accesses originating from the L1D memory system. An important class of TC accesses is EDMA transfers, which move data to or from the L2 memory. While the EDMA normally has no issue accessing L2 memory due to the high hit rates on the L1D memory system, there are pathological cases where certain CPU behavior could block the EDMA from accessing the L2 memory for long enough to cause a missed deadline when transferring data to a peripheral such as the McASP or McBSP. This can be avoided by setting the P bit to “1” because the EDMA will assume a higher priority than the L1D memory system when accessing L2 memory.

For more detailed information on the P-bit function and for silicon advisories concerning EDMA L2 memory accesses blocked, see the *TMS320C6712, TMS320C6712C, TMS320C6712D Digital Signal Processors Silicon Errata* (literature number SPRZ182C or later).

31	30	10	9	8	7	3	2	0
P†	Reserved			IP	ID	Reserved		L2MODE
R/W-0	R-x			W-0	W-0	R-0 0000		R/W-000

**Legend:** R = Readable; R/W = Readable/Writeable; -n = value after reset; -x = undefined value after reset

† Unlike the C6712/12C devices, the C6712D device includes a P bit.

**Figure 7. Cache Configuration Register (CCFG)**

**Table 19. CCFG Register Bit Field Description**

BIT #	NAME	DESCRIPTION
31	P	L1D requestor priority to L2 bit. P = 0: L1D requests to L2 higher priority than TC requests P = 1: TC requests to L2 higher priority than L1D requests
30:10	Reserved	Reserved. Read-only, writes have no effect.
9	IP	Invalidate L1P bit. 0 = Normal L1P operation 1 = All L1P lines are invalidated
8	ID	Invalidate L1D bit. 0 = Normal L1D operation 1 = All L1D lines are invalidated
7:3	Reserved	Reserved. Read-only, writes have no effect.
2:0	L2MODE	L2 operation mode bits (L2MODE).  000b = L2 Cache disabled (All SRAM mode) [64K SRAM] 001b = 1-way Cache (16K L2 Cache) / [48K SRAM] 010b = 2-way Cache (32K L2 Cache) / [32K SRAM] 011b = 3-way Cache (48K L2 Cache) / [16K SRAM] 111b = 4-way Cache (64K L2 Cache) / [no SRAM] All others Reserved

SGUS055 – SEPTEMBER 2004

## interrupt sources and interrupt selector [C6712 only]

The C67x DSP core on the C6712 supports 16 prioritized interrupts, which are listed in Table 20. The highest-priority interrupt is INT\_00 (dedicated to RESET) while the lowest-priority interrupt is INT\_15. The first four interrupts (INT\_00–INT\_03) are non-maskable and fixed. The remaining interrupts (INT\_04–INT\_15) are maskable and default to the interrupt source specified in Table 20. The interrupt source for interrupts 4–15 can be programmed by modifying the selector value (binary value) in the corresponding fields of the Interrupt Selector Control registers: MUXH (address 0x019C0000) and MUXL (address 0x019C0004).

**Table 20. C6712 DSP Interrupts**

DEFAULT INTERRUPT NUMBER	INTERRUPT SELECTOR CONTROL REGISTER	DEFAULT SELECTOR VALUE (BINARY)	INTERRUPT EVENT	INTERRUPT SOURCE
INT_00	–	–	RESET	
INT_01	–	–	NMI	
INT_02	–	–	Reserved	Reserved. Do not use.
INT_03	–	–	Reserved	Reserved. Do not use.
INT_04	MUXL[4:0]	00100	EXT_INT4	External interrupt pin 4
INT_05	MUXL[9:5]	00101	EXT_INT5	External interrupt pin 5
INT_06	MUXL[14:10]	00110	EXT_INT6	External interrupt pin 6
INT_07	MUXL[20:16]	00111	EXT_INT7	External interrupt pin 7
INT_08	MUXL[25:21]	01000	EDMA_INT	EDMA channel (0 through 15) interrupt
INT_09	MUXL[30:26]	01001	Reserved	None, but programmable
INT_10	MUXH[4:0]	00011	SD_INT	EMIF SDRAM timer interrupt
INT_11	MUXH[9:5]	01010	Reserved	None, but programmable
INT_12	MUXH[14:10]	01011	Reserved	None, but programmable
INT_13	MUXH[20:16]	00000	Reserved	None, but programmable
INT_14	MUXH[25:21]	00001	TINT0	Timer 0 interrupt
INT_15	MUXH[30:26]	00010	TINT1	Timer 1 interrupt
–	–	01100	XINT0	McBSP0 transmit interrupt
–	–	01101	RINT0	McBSP0 receive interrupt
–	–	01110	XINT1	McBSP1 transmit interrupt
–	–	01111	RINT1	McBSP1 receive interrupt
–	–	10000 – 11111	Reserved	Reserved. Do not use.

† Interrupts INT\_00 through INT\_03 are non-maskable and fixed.

‡ Interrupts INT\_04 through INT\_15 are programmable by modifying the binary selector values in the Interrupt Selector Control registers fields. Table 20 shows the default interrupt sources for interrupts INT\_04 through INT\_15. For more detailed information on interrupt sources and selection, see the *TMS320C6000 DSP Interrupt Selector Reference Guide* (literature number SPRU646).

**interrupt sources and interrupt selector [C6712C/C6712D only]**

The C67x DSP core on the C6712C/C6712D supports 16 prioritized interrupts, which are listed in Table 21. The highest priority interrupt is INT\_00 (dedicated to RESET) while the lowest priority is INT\_15. The first four interrupts are non-maskable and fixed. The remaining interrupts (4–15) are maskable and default to the interrupt source listed in Table 21. However, their interrupt source may be reprogrammed to any one of the sources listed in Table 22 (Interrupt Selector). Table 22 lists the selector value corresponding to each of the alternate interrupt sources. The selector choice for interrupts 4–15 is made by programming the corresponding fields (listed in Table 21) in the MUXH (address 0x019C0000) and MUXL (address 0x019C0004) registers.

**Table 21. DSP Interrupts [C6712C/C6712D]**

DSP INTERRUPT NUMBER	INTERRUPT SELECTOR CONTROL REGISTER	DEFAULT SELECTOR VALUE (BINARY)	DEFAULT INTERRUPT EVENT
INT_00	–	–	RESET
INT_01	–	–	NMI
INT_02	–	–	Reserved
INT_03	–	–	Reserved

INT_14	MUXH[25:21]	00001	TINT0
INT_15	MUXH[30:26]	00010	TINT1

**Table 22. Interrupt Selector [12C/12D]**

INTERRUPT SELECTOR VALUE (BINARY)	INTERRUPT EVENT	MODULE
00000	–	–
00001	TINT0	Timer 0
00010	TINT1	Timer 1
00011	SDINT	EMIF
00100	GPINT4†	GPIO
00101	GPINT5†	GPIO
00110	GPINT6†	GPIO
00111	GPINT7†	GPIO
01000	EDMAINT	EDMA
01001	EMUDTDMA	Emulation
01010	EMURTDXR	Emulation
01011	EMURTDXTX	Emulation
01100	XINT0	McBSP0
01101	RINT0	McBSP0
01110	XINT1	McBSP1
01111	RINT1	McBSP1
10000	GPINT0	GPIO

† Interrupt Events GPINT4, GPINT5, GPINT6, and GPINT7 are outputs from the GPIO module (GP). They originate from the device pins GP[4](EXT\_INT4), GP[5](EXT\_INT5), GP[6](EXT\_INT6), and GP[7](EXT\_INT7). These pins can be used as edge-sensitive EXT\_INTx with polarity controlled by the External Interrupt Polarity Register (EXTPOL.[3:0]). The corresponding pins must first be *enabled* in the GPIO module by setting the corresponding enable bits in the GP Enable Register (GPEN.[7:4]), and configuring them as *inputs* in the GP Direction Register (GPDIR.[7:4]). These interrupts can be controlled through the GPIO module in addition to the simple EXTPOL.[3:0] bits. For more information on interrupt control via the GPIO module, see the *TMS320C6000 DSP General-Purpose Input/Output (GPIO) Reference Guide* (literature number SPRU584). [C6712C/C6712D only].

# SM320C6712-EP, SM320C6712C-EP, SM320C6712D-EP FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SGUS055 – SEPTEMBER 2004

## EDMA channel synchronization events [C6712 only]

The C67x EDMA on the C6712 device supports up to 16 EDMA channels. Four of the sixteen channels (channels 8–11) are reserved for EDMA chaining, leaving 12 EDMA channels available to service peripheral devices. Table 23 lists the source of synchronization events associated with each of the programmable EDMA channels. For the C6712, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. For more detailed information on the EDMA module, associated channels, and event-transfer chaining, see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

**Table 23. 320C6712 EDMA Channel Synchronization Events**

EDMA CHANNEL	EVENT NAME	EVENT DESCRIPTION
0	–	Reserved
1	TINT0	Timer 0 interrupt
2	TINT1	Timer 1 interrupt
3	SD_INT	EMIF SDRAM timer interrupt
4	EXT_INT4	External interrupt pin 4
5	EXT_INT5	External interrupt pin 5
6	EXT_INT6	External interrupt pin 6
7	EXT_INT7	External interrupt pin 7
8†	EDMA_TCC8	EDMA transfer complete code (TCC) 1000b interrupt
9†	EDMA_TCC9	EDMA TCC 1001b interrupt
10†	EDMA_TCC10	EDMA TCC 1010b interrupt
11†	EDMA_TCC11	EDMA TCC 1011b interrupt
12	XEVT0	McBSP0 transmit event
13	REVT0	McBSP0 receive event
14	XEVT1	McBSP1 transmit event
15	REVT1	McBSP1 receive event

† EDMA channels 8 through 11 are used for transfer chaining only. For more detailed information on event-transfer chaining, see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

**EDMA module and EDMA selector [12C/12D only]**

The C67x EDMA for the C6712C/C6712D device also supports up to 16 EDMA channels. Four of the sixteen channels (channels 8–11) are reserved for EDMA chaining, leaving 12 EDMA channels available to service peripheral devices. On the C6712C/C6712D device, the user, through the EDMA selector registers, can control the EDMA channels servicing peripheral devices.

The EDMA selector registers are located at addresses 0x01A0FF00 (ESEL0), 0x01A0FF04 (ESEL1), and 0x01A0FF0C (ESEL3). These EDMA selector registers control the mapping of the EDMA events to the EDMA channels. Each EDMA event has an assigned EDMA selector code (see Table 25). By loading each EVTSELx register field with an EDMA selector code, users can map any desired EDMA event to any specified EDMA channel. Table 24 lists the default EDMA selector value for each EDMA channel.

See Table 24 and Table 25 for the EDMA Event Selector registers and their associated bit descriptions.

**Table 24. EDMA Channels [C6712C/C6712D Only]**

EDMA CHANNEL	EDMA SELECTOR CONTROL REGISTER	DEFAULT SELECTOR VALUE (BINARY)	DEFAULT EDMA EVENT

**Table 27. EDMA Event Selection Registers (ESEL0, ESEL1, and ESEL3) Description**

BIT #	NAME	DESCRIPTION
31:30 23:22 15:14 7:6	Reserved	Reserved. Read-only, writes have no effect.
29:24 21:16 13:8 5:0	EVTSELx	EDMA event selection bits for channel x. Allows mapping of the EDMA events to the EDMA channels.  The EVTSEL0 through EVTSEL15 bits correspond to the channels 0 to 15, respectively. These EVTSELx fields are user-selectable. By configuring the EVTSELx fields to the EDMA selector value of the desired EDMA sync event number (see Table 25), users can map any EDMA event to the EDMA channel.  For example, if EVTSEL15 is programmed to 00 0001b (the EDMA selector code for TINT0), then channel 15 is triggered by Timer0 TINT0 events.

**clock PLL [C6712 only]**

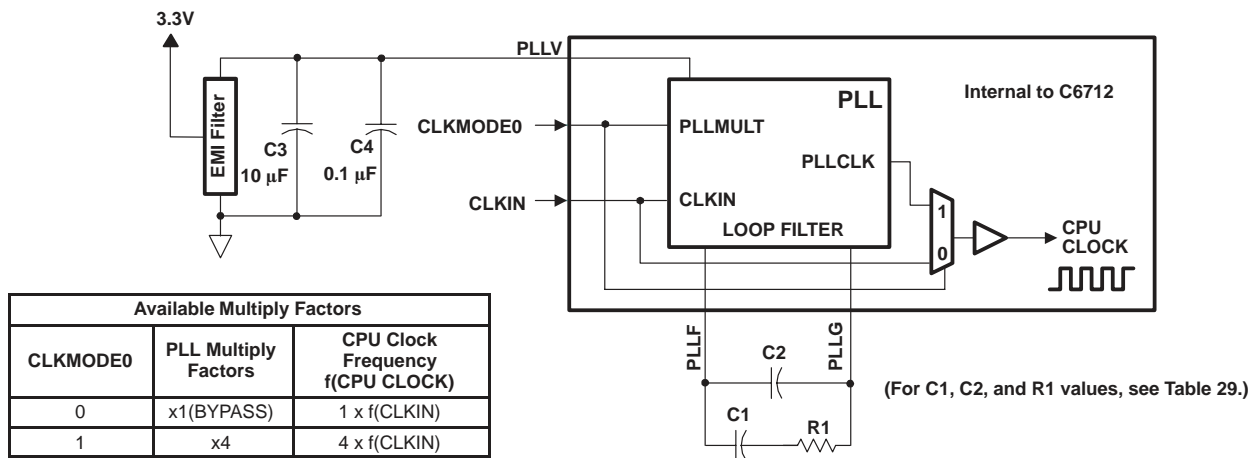

All of the internal C6712 clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock in frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 8 shows the external PLL circuitry for either x1 (PLL bypass) or x4 PLL multiply modes. Figure 9 shows the external PLL circuitry for a system with ONLY x1 (PLL bypass) mode.

To minimize the clock jitter, a single clean power supply should power both the C6712 device and the external clock oscillator circuit. Noise coupling into PLLF will directly impact PLL clock jitter. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section. Table 28 lists some examples of compatible CLKIN external clock sources.

**Table 28. Compatible CLKIN External Clock Sources [C6712]**

COMPATIBLE PARTS FOR EXTERNAL CLOCK SOURCES (CLKIN)	PART NUMBER	MANUFACTURER
Oscillators	JITO-2	Fox Electronix
	STA series, ST4100 series	SaRonix Corporation
	SG-636	Epson America
	342	Corning Frequency Control
PLL	ICS525-02	Integrated Circuit Systems

- NOTES:
- A. Keep the lead length and the number of vias between the PLLF pin, the PLLG pin, and R1, C1, and C2 to a minimum. In addition, place all PLL external components (R1, C1, C2, C3, C4, and the EMI Filter) as close to the C6000™ DSP device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown.
  - B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (R1, C1, C2, C3, C4, and the EMI filter).
  - C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.
  - D. EMI filter manufacturer: TDK part number ACF451832-333, 223, 153, 103. Panasonic part number EXCCET103U.

**Figure 8. External PLL Circuitry for Either PLL x4 Mode or x1 (Bypass) Mode [C6712]**

# SM320C6712-EP, SM320C6712C-EP, SM320C6712D-EP FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SGUS055 – SEPTEMBER 2004

## clock PLL [C6712 only] (continued)

- NOTES: A. For a system with ONLY PLL x1 (bypass) mode, short the PLLF terminal to the PLLG terminal.  
 B. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.

**Figure 9. External PLL Circuitry for x1 (Bypass) Mode Only [C6712]**

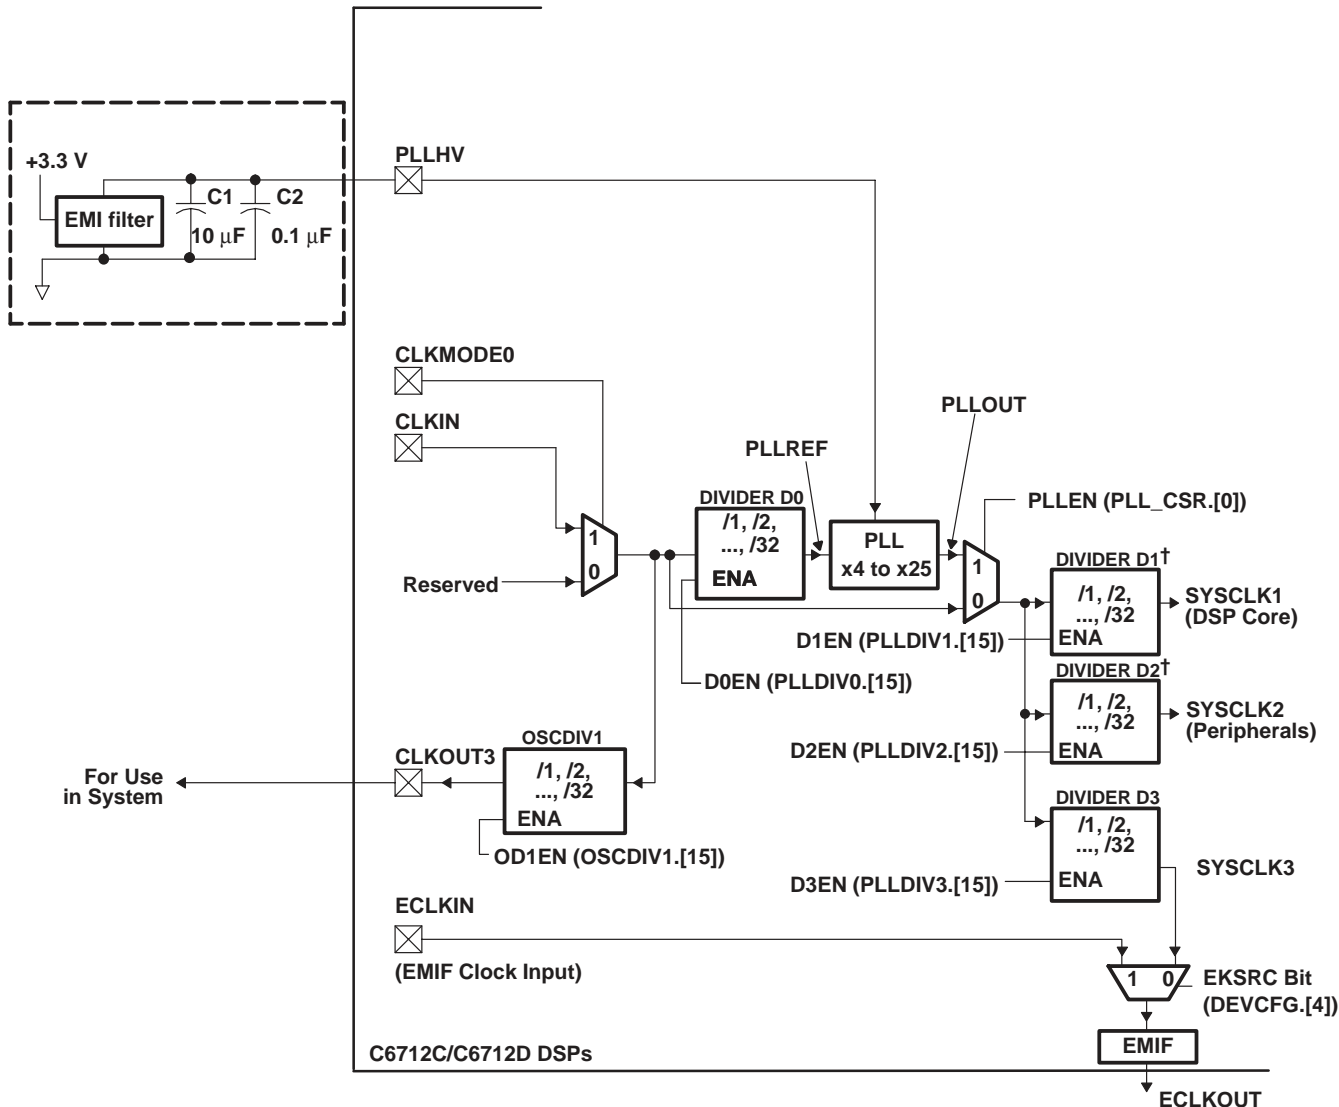

**Table 29. C6712 PLL Component Selection Table**

CLKMODE	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY (CLKOUT1) RANGE (MHz)	CLKOUT2 RANGE (MHz)	R1 [ $\pm 1\%$ ] ( $\Omega$ )	C1 [ $\pm 10\%$ ] (nF)	C2 [ $\pm 10\%$ ] (pF)	TYPICAL LOCK TIME ( $\mu$ s) <sup>†</sup>
x4	16.3–37.5	65–150	32.5–75	60.4	27	560	75

<sup>†</sup> Under some operating conditions, the maximum PLL lock time may vary as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100  $\mu$ s, the maximum value may be as long as 250  $\mu$ s.

PLL and PLL controller [C6712C/C6712D only]

The 320C6712C/C6712D includes a PLL and a flexible PLL controller peripheral consisting of a prescaler (D0) and four dividers (OSCDIV1, D1, D2, and D3). The PLL controller is able to generate different clocks for different parts of the system (i.e., DSP core, Peripheral Data Bus, External Memory Interface, McASP, and other peripherals). Figure 10 illustrates the PLL, the PLL controller, and the clock generator logic.

† Dividers D1 and D2 must never be disabled. Never write a "0" to the D1EN or D2EN bits in the PLLDIV1 and PLLDIV2 registers.

- NOTES:
- A. Place all PLL external components (C1, C2, and the EMI Filter) as close to the C67x™ DSP device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown.
  - B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).
  - C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.
  - D. EMI filter manufacturer TDK part number ACF451832-333, -223, -153, -103. Panasonic part number EXCET103U.

SGUS055 – SEPTEMBER 2004

## PLL and PLL controller [C6712C/C6712D only] (continued)

The PLL Reset Time is the amount of wait time needed when resetting the PLL (writing PLLRST=1), in order for the PLL to properly reset, before bringing the PLL out of reset (writing PLLRST = 0). For the PLL Reset Time value, see Table 30. The PLL Lock Time is the amount of time from when PLLRST = 0 with PLEN = 0 (PLL out of reset, but still bypassed) to when the PLEN bit can be safely changed to “1” (switching from bypass to the PLL path), see Table 30 and Figure 10.

Under some operating conditions, the maximum PLL Lock Time may vary from the specified typical value. For the PLL Lock Time values, see Table 30.

**Table 30. PLL Lock and Reset Times (C6712C/C6712D only)**

	MIN	TYP	MAX	UNIT
PLL Lock Time		75	187.5	μs
PLL Reset Time	125			ns

Table 31 shows the C6712C/C6712D device’s CLKOUT signals, how they are derived and by what register control bits, and the default settings. For more details on the PLL, see the PLL and Clock Generator Logic diagram (Figure 10).

**Table 31. CLKOUT Signals, Default Settings, and Control**

CLOCK OUTPUT SIGNAL NAME	DEFAULT SETTING (ENABLED or DISABLED)	CONTROL BIT(s) (Register)	DESCRIPTION
CLKOUT2	ON (ENABLED)	D2EN = 1 (PLLDIV2.[15]) CK2EN = 1 (EMIF GBLCTL.[3])	SYSCLK2 selected [default]
CLKOUT3	ON (ENABLED)	OD1EN = 1 (OSCDIV1.[15])	Derived from CLKIN
ECLKOUT	ON (ENABLED); derived from SYSCLK3	EKSRC = 0 (DEVCFG.[4]) EKEN = 1 (EMIF GBLCTL.[5])	SYSCLK3 selected [default].  To select ECLKIN as source: EKSRC = 1 (DEVCFG.[4]) and EKEN = 1 (EMIF GBLCTL.[5])

This input clock is directly available as an internal high-frequency clock source that may be divided down by a programmable divider OSCDIV1 (/1, /2, /3, ..., /32) and output on the CLKOUT3 pin for other use in the system.

Figure 10 shows that the input clock source may be divided down by divider PLLDIV0 (/1, /2, ..., /32) and then multiplied up by a factor of x4, x5, x6, and so on, up to x25.

Either the input clock (PLEN = 0) or the PLL output (PLEN = 1) then serves as the high-frequency reference clock for the rest of the DSP system. The DSP core clock, the peripheral bus clock, and the EMIF clock may be divided down from this high-frequency clock (each with a unique divider) . For example, with a 40-MHz input, if the PLL output is configured for 300 MHz, the DSP core may be operated at 150 MHz (/2) while the EMIF may be configured to operate at a rate of 60 MHz (/5). Note that there is a specific minimum and maximum reference clock (PLLREF) and output clock (PLLOUT) for the block labeled PLL in Figure 10, as well as for the DSP core, peripheral bus, and EMIF. The clock generator must not be configured to exceed any of these constraints (certain combinations of external clock input, internal dividers, and PLL multiply ratios might not be supported). See Table 32 for the PLL clocks input and output frequency ranges.

PLL and PLL controller [C6712C/C6712D only] (continued)

Table 32. PLL Clock Frequency Ranges†‡

CLOCK SIGNAL	GDP16		UNIT
	MIN	MAX	
PLLREF (PLEN = 1)	12	100	MHz
PLLOUT	140	600	MHz
SYSCLK1	–	Device Speed (DSP Core)	MHz
SYSCLK3 (EKSRC = 0)	–	100	MHz

† SYSCLK2 rate **must** be exactly half of SYSCLK1.

‡ Also see the electrical specification (timing requirements and switching characteristics parameters) in the Input and Output Clocks section of this data sheet.

The EMIF itself may be clocked by an external reference clock via the ECLKIN pin or can be generated on-chip as SYSCLK3. SYSCLK3 is derived from divider D3 off of PLLOUT (see Figure 10, PLL and Clock Generator Logic). The EMIF clock selection is programmable via the EKSRC bit in the DEVCFG register.

The settings for the PLL multiplier and each of the dividers in the clock generation block may be reconfigured via software at run time. If either the input to the PLL changes due to D0, CLKMODE0, or CLKIN, or if the PLL multiplier is changed, then software must enter bypass first and stay in bypass until the PLL has had enough time to lock (see electrical specifications). For the programming procedure, see the *TMS320C6000 DSP Software-Programmable Phase-Locked Loop (PLL) Controller Reference Guide* (literature number SPRU233).

SYSCLK2 is the internal clock source for peripheral bus control. SYSCLK2 (Divider D2) **must** be programmed to be half of the SYSCLK1 rate. For example, if D1 is configured to divide-by-2 mode (/2), then D2 **must** be programmed to divide-by-4 mode (/4). SYSCLK2 is also tied directly to CLKOUT2 pin (see Figure 10).

During the programming transition of Divider D1 and Divider D2 (resulting in SYSCLK1 and SYSCLK2 output clocks, see Figure 10), the order of programming the PLLDIV1 and PLLDIV2 registers must be observed to ensure that SYSCLK2 always runs at half the SYSCLK1 rate or slower. For example, if the divider ratios of D1 and D2 are to be changed from /1, /2 (respectively) to /5, /10 (respectively) then, the PLLDIV2 register must be programmed before the PLLDIV1 register. The transition ratios become /1, /2; /1, /10; and then /5, /10. If the divider ratios of D1 and D2 are to be changed from /3, /6 to /1, /2 then, the PLLDIV1 register must be programmed before the PLLDIV2 register. The transition ratios, for this case, become /3, /6; /1, /6; and then /1, /2. The final SYSCLK2 rate **must** be exactly half of the SYSCLK1 rate.

Note that Divider D1 and Divider D2 must **always** be enabled (i.e., D1EN and D2EN bits are set to “1” in the PLLDIV1 and PLLDIV2 registers).

For detailed information on the clock generator (PLL Controller registers) and their associated software bit descriptions, see Table 33 through Table 36.

SGUS055 – SEPTEMBER 2004

## general-purpose input/output (GPIO)

To use the GP[7:4, 2] software-configurable GPIO pins, the GPxEN bits in the GP Enable (GPEN) Register and the GPxDIR bits in the GP Direction (GPDIR) Register must be properly configured.

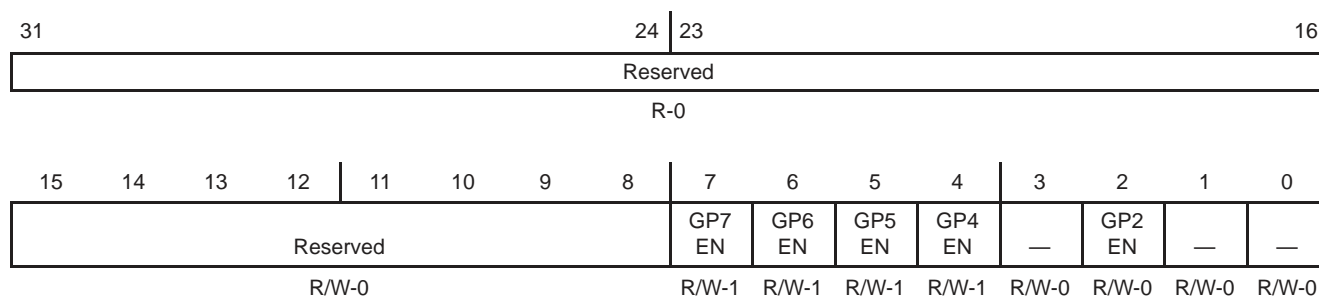

GPxEN = 1 GP[x] pin is enabled

GPxDIR = 0 GP[x] pin is an input

GPxDIR = 1 GP[x] pin is an output

where “x” represents one of the 7 through 4, or 2 GPIO pins

Figure 11 shows the GPIO enable bits in the GPEN register for the C6712C and C6712D devices. To use any of the GPx pins as general-purpose input/output functions, the corresponding GPxEN bit must be set to “1” (enabled). Default values are device-specific, so refer to Figure 11 for the C6712C/C6712D default configuration.

**Legend:** R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

**Figure 11. GPIO Enable Register (GPEN) [Hex Address: 01B0 0000]**

Figure 12 shows the GPIO direction bits in the GPDIR register. This register determines if a given GPIO pin is an input or an output providing the corresponding GPxEN bit is enabled (set to “1”) in the GPEN register. By default, all the GPIO pins are configured as input pins.

**Legend:** R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

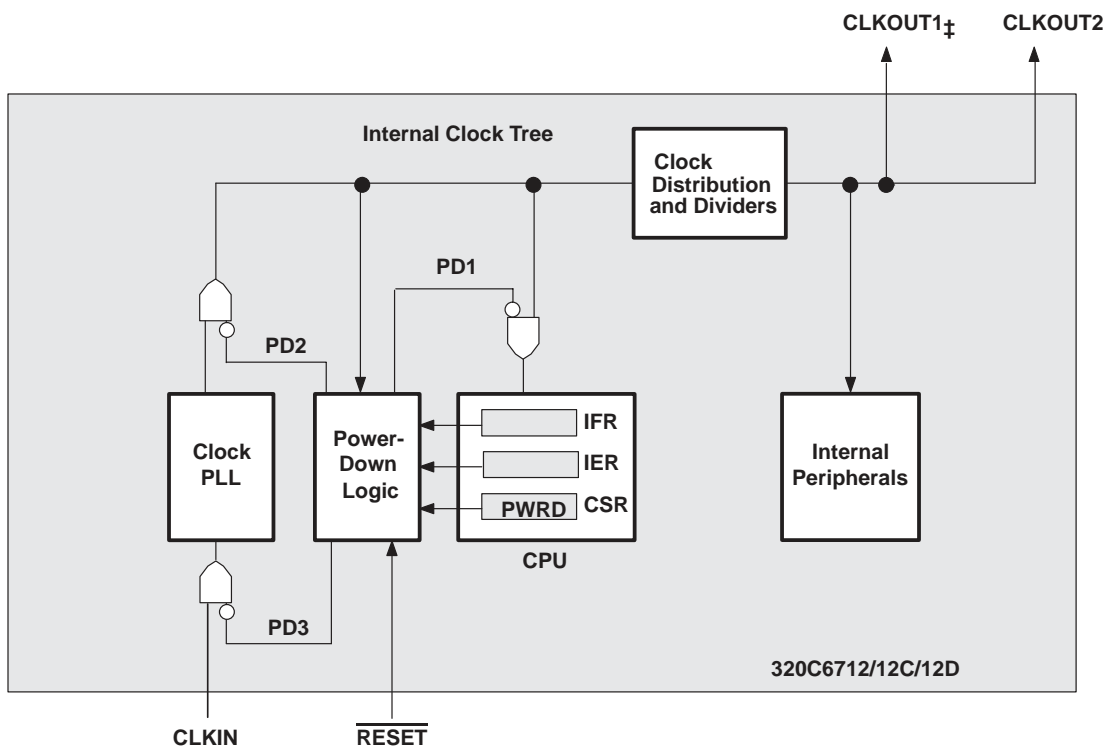

**Figure 12. GPIO Direction Register (GPDIR) [Hex Address: 01B0 0004]**

For more detailed information on general-purpose inputs/outputs (GPIOs), see the *TMS320C6000 DSP General-Purpose Input/Output (GPIO) Reference Guide* (literature number SPRU584).

power-down mode logic

Figure 13 shows the power-down mode logic on the C6712C/12D.

† External input clocks, with the exception of CLKOUT3 [12C/12D only] and CLKIN, are *not* gated by the power-down mode logic.  
 ‡ CLKOUT1 is applicable on the C6712 device only.

Figure 13. Power-Down Mode Logic†

triggering, wake-up, and effects

The power-down modes and their wake-up methods are programmed by setting the PWRD field (bits 15–10) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 14 and described in Table 37. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when “writing” to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

# SM320C6712-EP, SM320C6712C-EP, SM320C6712D-EP FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SGUS055 – SEPTEMBER 2004

**Legend:** R/W-x = Read/write reset value

**NOTE:** The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

**Figure 14. PWRD Field of the CSR Register**

A delay of up to nine clock cycles may occur after the instruction that sets the PWRD bits in the CSR before the PD mode takes effect. As best practice, NOPs should be padded after the PWRD bits are set in the CSR to account for this delay.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. In the case with an enabled, interrupt, the GIE bit in the CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 37 summarizes all the power-down modes.

**Table 37. Characteristics of the Power-Down Modes**

PRWD FIELD (BITS 15–10)	POWER-DOWN MODE	WAKE-UP METHOD	EFFECT ON CHIP'S OPERATION
000000	No power-down	—	—
001001	PD1	Wake by an enabled interrupt	CPU halted (except for the interrupt logic) Power-down mode blocks the internal clock inputs at the boundary of the CPU, preventing most of the CPU's logic from switching. During PD1, EDMA transactions can proceed between peripherals and internal memory.
010001	PD1	Wake by an enabled or non-enabled interrupt	
011010	PD2 <sup>†</sup>	Wake by a device reset	Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off.
011100	PD3 <sup>†</sup>	Wake by a device reset	Input clock to the PLL stops generating clocks. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked, just as it does following power-up.
All others	Reserved	—	—

<sup>†</sup> When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

On C6712D silicon revision 2.0 and C6712C silicon revision 1.1, the device includes a programmable PLL which allows software control of PLL bypass via the PLEN bit in the PLLCSR register. With this enhanced functionality comes some additional considerations when entering power-down modes.

The power-down modes (PD2 and PD3) function by disabling the PLL to stop clocks to the device. However, if the PLL is bypassed (PLEN = 0), the device will still receive clocks from the external clock input (CLKIN). Therefore, bypassing the PLL makes the power-down modes PD2 and PD3 ineffective.

Make sure that the PLL is enabled by writing a "1" to PLEN bit (PLLCSR.0) before writing to either PD3 (CSR.11) or PD2 (CSR.10) to enter a power-down mode.

### power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time (>1 second) if the other supply is below the proper operating voltage.

### system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, for **C6712**, the core supply should be powered up at the same time as, or prior to (and powered down after) the I/O buffers. For **C6712C/12D**, the core supply should be powered up prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

### power-supply design considerations

A dual-power supply with simultaneous sequencing can be used to eliminate the delay between core and I/O power up. A Schottky diode can also be used to tie the core rail to the I/O rail (see Figure 15).

# SM320C6712-EP, SM320C6712C-EP, SM320C6712D-EP FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SGUS055 – SEPTEMBER 2004

**Figure 15. Schottky Diode Diagram**

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

### ***C6712 device applicable only***

On systems using C62x and C67x DSPs, like the C6712 device, the core may consume in excess of 2 A per DSP until the I/O supply powers on. This extra current results from uninitialized logic within the DSP(s). A normal current state returns once the I/O power supply turns on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power-up and the I/O supply power-up reduces the effects of the current draw. If the external supply to the DSP core cannot supply the excess current, the minimum core voltage may not be achieved until after normal current returns. This voltage starvation of the core supply during power up will not affect run-time operation. Voltage starvation can affect power supply systems that gate the I/O supply via the core supply, causing the I/O supply to never turn on. During the transition from excess to normal current, a voltage spike may be seen on the core supply. Care must be taken when designing overvoltage protection circuitry on the core supply to not restart the power sequence due to this spike. Otherwise, the supply may cycle indefinitely.

## power-supply decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. Assuming 0603 caps, the user should be able to fit a total of 60 caps — 30 for the core supply and 30 for the I/O supply. These caps need to be close (no more than 1.25 cm maximum distance) to the DSP to be effective. Physically smaller caps are better, such as 0402, but the size needs to be evaluated from a yield/manufacturing point-of-view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value. As with the selection of any component, verification of capacitor availability over the product's production lifetime needs to be considered.

## IEEE 1149.1 JTAG compatibility statement

The 320C6712/12C/12D DSP requires that both  $\overline{\text{TRST}}$  and  $\overline{\text{RESET}}$  be asserted upon power up to be properly initialized. While  $\overline{\text{RESET}}$  initializes the DSP core,  $\overline{\text{TRST}}$  initializes the DSP's emulation logic. Both resets are required for proper operation.

While both  $\overline{\text{TRST}}$  and  $\overline{\text{RESET}}$  need to be asserted upon power up, only  $\overline{\text{RESET}}$  needs to be released for the DSP to boot properly.  $\overline{\text{TRST}}$  may be asserted indefinitely for normal operation, keeping the JTAG port interface and DSP's emulation logic in the reset state.

$\overline{\text{TRST}}$  only needs to be released when it is necessary to use a JTAG controller to debug the DSP or exercise the DSP's boundary scan functionality.

For maximum reliability, the 320C6712/12C/12D DSP includes an internal pulldown (IPD) on the  $\overline{\text{TRST}}$  pin to ensure that  $\overline{\text{TRST}}$  will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive  $\overline{\text{TRST}}$  high. However, some third-party JTAG controllers may not drive  $\overline{\text{TRST}}$  high but expect the use of a pullup resistor on  $\overline{\text{TRST}}$ .

When using this type of JTAG controller, assert  $\overline{\text{TRST}}$  to initialize the DSP after powerup and externally drive  $\overline{\text{TRST}}$  high before attempting any emulation or boundary scan operations. Following the release of  $\overline{\text{RESET}}$ , the low-to-high transition of  $\overline{\text{TRST}}$  must be "seen" to latch the state of EMU1 and EMU0. The EMU[1:0] pins configure the device for either Boundary Scan mode or Emulation mode. For more detailed information, see the terminal functions section of this data sheet.

## EMIF device speed

The maximum EMIF speed on the C6712C/C6712D device is 100 MHz. TI recommends utilizing I/O buffer information specification (IBIS) to analyze all AC timings to determine if the maximum EMIF speed is achievable for a given board layout. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839).

For ease of design evaluation, Table 38 contains IBIS simulation results showing the maximum EMIF-SDRAM interface speeds for the given example boards (TYPE) and SDRAM speed grades. Timing analysis should be performed to verify that all AC timings are met for the specified board layout. Other configurations are also possible, but again, timing analysis must be done to verify proper AC timings.

To maintain signal integrity, serial termination resistors should be inserted into all EMIF output signal lines (see the Terminal Functions table for the EMIF output signals).

# SM320C6712-EP, SM320C6712C-EP, SM320C6712D-EP FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SGUS055 – SEPTEMBER 2004

**Table 38. C6712C/C6712D Example Boards and Maximum EMIF Speed**

BOARD CONFIGURATION			SDRAM SPEED GRADE	MAXIMUM ACHIEVABLE EMIF-SDRAM INTERFACE SPEED
TYPE	EMIF INTERFACE COMPONENTS	BOARD TRACE		
1-Load Short Traces	One bank of one 32-Bit SDRAM	1 to 3-inch traces with proper termination resistors; Trace impedance ~ 50 Ω	143 MHz 32-bit SDRAM (-7)	100 MHz
			166 MHz 32-bit SDRAM (-6)	For short traces, SDRAM data output hold time on these SDRAM speed grades cannot meet EMIF input hold time requirement (see NOTE 1).
			183 MHz 32-bit SDRAM (-55)	
			200 MHz 32-bit SDRAM (-5)	
2-Loads Short Traces	One bank of two 16-Bit SDRAMs	1.2 to 3 inches from EMIF to each load, with proper termination resistors; Trace impedance ~ 78 Ω	125 MHz 16-bit SDRAM (-8E)	100 MHz
			133 MHz 16-bit SDRAM (-75)	100 MHz
			143 MHz 16-bit SDRAM (-7E)	100 MHz
			167 MHz 16-bit SDRAM (-6A)	100 MHz
			167 MHz 16-bit SDRAM (-6)	100 MHz
3-Loads Short Traces	One bank of two 32-Bit SDRAMs One bank of buffer	1.2 to 3 inches from EMIF to each load, with proper termination resistors; Trace impedance ~ 78 Ω	125 MHz 16-bit SDRAM (-8E)	For short traces, EMIF cannot meet SDRAM input hold requirement (see NOTE 1).
			133 MHz 16-bit SDRAM (-75)	100 MHz
			143 MHz 16-bit SDRAM (-7E)	100 MHz
			167 MHz 16-bit SDRAM (-6A)	100 MHz
			167 MHz 16-bit SDRAM (-6)	For short traces, EMIF cannot meet SDRAM input hold requirement (see NOTE 1).
3-Loads Long Traces	One bank of one 32-Bit SDRAM One bank of one 32-Bit SDRAM One bank of buffer	4 to 7 inches from EMIF; Trace impedance ~ 63 Ω	143 MHz 32-bit SDRAM (-7)	83 MHz
			166 MHz 32-bit SDRAM (-6)	83 MHz
			183 MHz 32-bit SDRAM (-55)	83 MHz
			200 MHz 32-bit SDRAM (-5)	SDRAM data output hold time cannot meet EMIF input hold requirement (see NOTE 1).

NOTE 1: Results are based on IBIS simulations for the given example boards (TYPE). Timing analysis should be performed to determine if timing requirements can be met for the particular system.

## EMIF big endian mode correctness [C6712D only]

The device Endian mode pin (LENDIAN) selects the endian mode of operation (little endian or big endian) for the C6712D device. Little endian is the default setting.

When Big Endian mode is selected (LENDIAN = 0), the EMIF Big Endian mode correctness pin ( $\overline{\text{EMIFBE}}$ ) **must** be pulled low. Figure 16 shows the mapping of 16-bit and 8-bit data for C6712D devices with EMIF endianness correction.

EMIF DATA LINES (PINS) WHERE DATA PRESENT	
ED[15:8] ( $\overline{\text{BE1}}$ )	ED[7:0] ( $\overline{\text{BE0}}$ )
16-Bit Device in Any Endianness Mode	
8-Bit Device in Any Endianness Mode	

† The C6712/C6712C devices support Little Endian mode of operation only.

**Figure 16. 16/8-Bit EMIF Big Endian Mode Correctness Mapping [C6712D Only]†**

This new feature does *not* affect systems operating in Little Endian mode, providing the default value of the C15 pin =1 is used.

**bootmode**

The C67x™ device resets using the active-low signal  $\overline{\text{RESET}}$  and the internal reset signal (C6712C/C6712D; for the C6712 device, the  $\overline{\text{RESET}}$  signal is the same as the internal reset signal). While  $\overline{\text{RESET}}$  is low, the internal reset is also asserted and the device is held in reset and is initialized to the prescribed reset state. Refer to reset timing for reset timing characteristics and states of device pins during reset. The release of the internal reset signal (see the Reset Phase 3 discussion in the Reset Timing section of this data sheet) starts the processor running with the prescribed device configuration and boot mode.

The C6712/C6712C/C6712D has two type of boot mode:

- Emulation boot

In Emulation boot mode, it is not necessary to load valid code into internal memory. The emulation driver will release the CPU from the “stalled” state, at which point the CPU will vector to address 0. Prior to beginning execution, the emulator sets a breakpoint at address 0. This prevents the execution of invalid code by halting the CPU prior to executing the first instruction. Emulation boot is a good tool in the debug phase of development.

- EMIF boot (using default ROM timings)

Upon the release of internal reset, the 1K-Byte ROM code located in the beginning of  $\overline{\text{CE1}}$  is copied to address 0 by the EDMA using the default ROM timings, while the CPU is internally “stalled”. The data should be stored in the endian format that the system is using. The boot process also lets you choose the width of the ROM. In this case, the EMIF automatically assembles consecutive 8-bit bytes or 16-bit half-words to form the 32-bit instruction words to be copied. The transfer is automatically done by the EDMA as a single-frame block transfer from the ROM to address 0. After completion of the block transfer, the CPU is released from the “stalled” state and starts running from address 0.

**absolute maximum ratings over operating case temperature range (unless otherwise noted)†**

Supply voltage range, $V_{DD}$ (see Note 2): (C6712C/C6712D only) . . . . .	– 0.3 V to 1.8 V
(C6712) . . . . .	– 0.3 V to 2.3 V
Supply voltage range, $DV_{DD}$ (see Note 2) . . . . .	–0.3 V to 4 V
Input voltage ranges: (C6712C/C6712D only) . . . . .	–0.3 V to $DV_{DD} + 0.5$ V
(C6712) . . . . .	–0.3 V to 4 V
Output voltage ranges: (C6712C/C6712D only) . . . . .	–0.3 V to $DV_{DD} + 0.5$ V
(C6712) . . . . .	–0.3 V to 4 V
Operating case temperature range, $T_C$ . . . . .	–40°C to 105°C
Storage temperature range, $T_{stg}$ . . . . .	–65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 2: All voltage values are with respect to  $V_{SS}$ .

† For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.

‡ For the **C6712** device, these currents were measured with average activity (50% high/50% low power). For more details on CPU, peripheral, and I/O activity, see the *TMS320C62x/C67x Power Consumption Summary* application report (literature number SPRA486).

For the **C6712C/12D** device, these currents were measured with average activity (50% high/50% low power) at 25°C case temperature and 100-MHz EMIF. This model represents a device performing high-DSP-activity operations 50% of the time, and the remainder performing low-DSP-activity operations. The high/low-DSP-activity models are defined as follows:

High-DSP-Activity Model:

- CPU: 8 instructions/cycle with 2 LDDW instructions [L1 Data Memory: 128 bits/cycle via LDDW instructions;
- L1 Program Memory: 256 bits/cycle; L2/EMIF EDMA: 50% writes, 50% reads to/from SDRAM (50% bit-switching)]
- McBSP: 2 channels at E1 rate
- Timers: 2 timers at maximum rate

Low-DSP-Activity Model:

- CPU: 2 instructions/cycle with 1 LDH instruction [L1 Data Memory: 16 bits/cycle; L1 Program Memory: 256 bits per 4 cycles;
- L2/EMIF EDMA: None]
- McBSP: 2 channels at E1 rate
- Timers: 2 timers at maximum rate

The actual current draw is highly application-dependent. For more details on core and I/O activity, refer to the *TMS320C6713/12C/11C Power Consumption Summary* application report (literature number SPRA889).

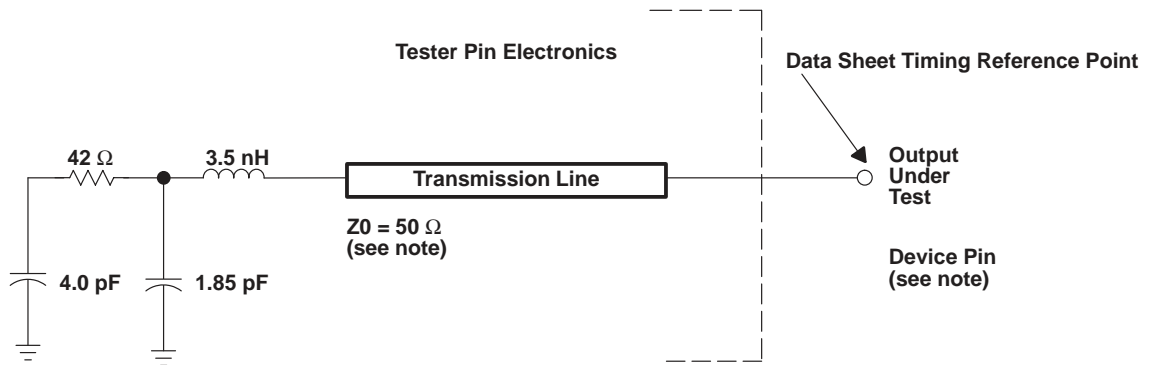

**PARAMETER MEASUREMENT INFORMATION**

Where:  $I_{OL}$  = 2 mA  
 $I_{OH}$  = 2 mA  
 $V_{comm+}$  = 0.8 V  
 $C_T$  = 10–15-pF typical load-circuit capacitance

**Figure 17. Test Load Circuit for AC Timing Measurements for C6712 Only**

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

**Figure 18. Test Load Circuit for AC Timing Measurements for C6712C/C6712D Only**

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

signal transition levels

All input and output timing parameters are referenced to 1.5 V for both “0” and “1” logic levels.

Figure 19. Input and Output Voltage Reference Levels for ac Timing Measurements

All rise and fall transition timing parameters are referenced to  $V_{IL\ MAX}$  and  $V_{IH\ MIN}$  for input clocks, and  $V_{OL\ MAX}$  and  $V_{OH\ MIN}$  for output clocks.

Figure 20. Rise and Fall Transition Time Voltage Reference Levels

timing parameters and board routing analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

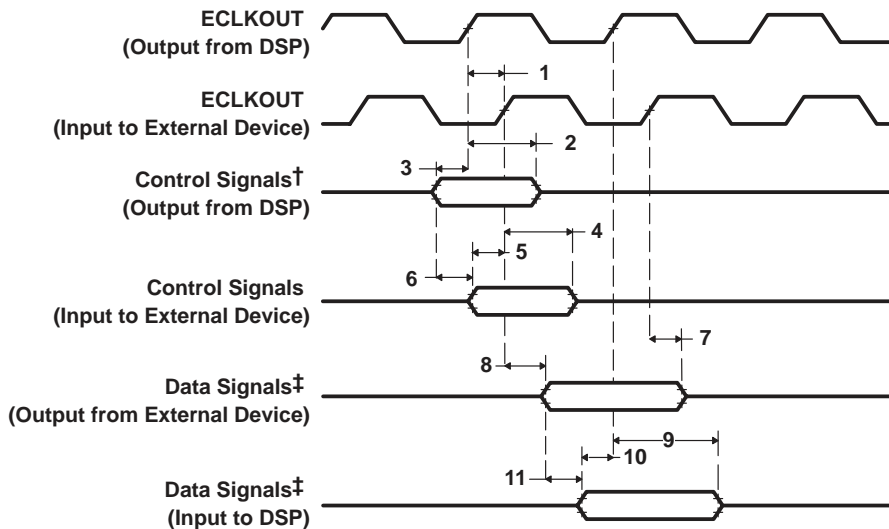

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see Table 39 and Figure 21).

Figure 21 represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

**PARAMETER MEASUREMENT INFORMATION (CONTINUED)**

**Table 39. Board-Level Timings Example (see Figure 21)**

NO.	DESCRIPTION
1	Clock route delay
2	Minimum DSP hold time
3	Minimum DSP setup time
4	External device hold time requirement
5	External device setup time requirement
6	Control signal route delay
7	External device hold time
8	External device access time
9	DSP hold time requirement
10	DSP setup time requirement
11	Data route delay

† Control signals include data for Writes.

‡ Data signals are generated during Reads from an external device.

**Figure 21. Board-Level Input/Output Timings**

INPUT AND OUTPUT CLOCKS

timing requirements for CLKIN†‡ (see Figure 22) [C6712]

NO.		-100				UNIT
		CLKMODE = x4		CLKMODE = x1		
		MIN	MAX	MIN	MAX	
1	$t_c(\text{CLKIN})$ Cycle time, CLKIN	40		10		ns
2	$t_w(\text{CLKINH})$ Pulse duration, CLKIN high	0.4C		0.45C		ns
3	$t_w(\text{CLKINL})$ Pulse duration, CLKIN low	0.4C		0.45C		ns
4	$t_t(\text{CLKIN})$ Transition time, CLKIN		5		1	ns

† The reference points for the rise and fall transitions are measured at  $V_{IL \text{ MAX}}$  and  $V_{IH \text{ MIN}}$ .

‡ C = CLKIN cycle time in ns. For example, when CLKIN frequency is 25 MHz, use C = 40 ns.

timing requirements for CLKIN†‡§ (see Figure 22) [C6712C/C6712D]

NO.		-167				UNIT
		PLL MODE (PLEN = 1)		BYPASS MODE (PLEN = 0)		
		MIN	MAX	MIN	MAX	
1	$t_c(\text{CLKIN})$ Cycle time, CLKIN	6	83.3	6		ns
2	$t_w(\text{CLKINH})$ Pulse duration, CLKIN high	0.4C		0.4C		ns
3	$t_w(\text{CLKINL})$ Pulse duration, CLKIN low	0.4C		0.4C		ns
4	$t_t(\text{CLKIN})$ Transition time, CLKIN		5		5	ns

† The reference points for the rise and fall transitions are measured at  $V_{IL \text{ MAX}}$  and  $V_{IH \text{ MIN}}$ .

‡ C = CLKIN cycle time in ns. For example, when CLKIN frequency is 25 MHz, use C = 40 ns.

§ See the PLL and PLL Controller section of this data sheet.

SGUS055 – SEPTEMBER 2004

## ASYNCHRONOUS MEMORY TIMING

timing requirements for asynchronous memory cycles<sup>†‡</sup> (see Figure 28–Figure 29)

NO.		-100		-167		UNIT
		MIN	MAX	MIN	MAX	
3	t <sub>su</sub> (EDV-AREH) Setup time, EDx valid before $\overline{\text{ARE}}$ high	13		6.5		ns
4	t <sub>h</sub> (AREH-EDV) Hold time, EDx valid after $\overline{\text{ARE}}$ high	1		1		ns
6	t <sub>su</sub> (ARDY-EKOH) Setup time, ARDY valid before ECLKOUT high	6		3		ns
7	t <sub>h</sub> (EKOH-ARDY) Hold time, ARDY valid after ECLKOUT high	1.7		2.3		ns

<sup>†</sup> To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. The ARDY signal is recognized in the cycle for which the setup and hold time is met. To use ARDY as an asynchronous input, the pulse width of the ARDY signal should be wide enough (e.g., pulse width = 2E) to ensure setup and hold time is met.

<sup>‡</sup> RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.

switching characteristics over recommended operating conditions for asynchronous memory cycles<sup>†§¶</sup> (see Figure 28–Figure 29)

NO.	PARAMETER	-100		-167		UNIT
		MIN	MAX	MIN	MAX	
1	t <sub>osu</sub> (SELV-AREL) Output setup time, select signals valid to $\overline{\text{ARE}}$ low	RS * E – 3		RS * E – 1.7		ns
2	t <sub>oh</sub> (AREH-SELIV) Output hold time, $\overline{\text{ARE}}$ high to select signals invalid	RH * E – 3		RH * E – 1.7		ns
5	t <sub>d</sub> (EKOH-AREV) Delay time, ECLKOUT high to $\overline{\text{ARE}}$ valid	1.5	11	1.5	7	ns
8	t <sub>osu</sub> (SELV-AWEL) Output setup time, select signals valid to $\overline{\text{AWE}}$ low	WS * E – 3		WS * E – 1.7		ns
9	t <sub>oh</sub> (AWEH-SELIV) Output hold time, $\overline{\text{AWE}}$ high to select signals and EDx invalid	WH * E – 3		WH * E – 1.7		ns
10	t <sub>d</sub> (EKOH-AWEV) Delay time, ECLKOUT high to $\overline{\text{AWE}}$ valid	1.5	11	1.5	7	ns
11	t <sub>osu</sub> (EDV-AWEL) Output setup time, ED valid to $\overline{\text{AWE}}$ low	(WS–1)*E – 1.7		(WS–1)*E – 1.7		ns

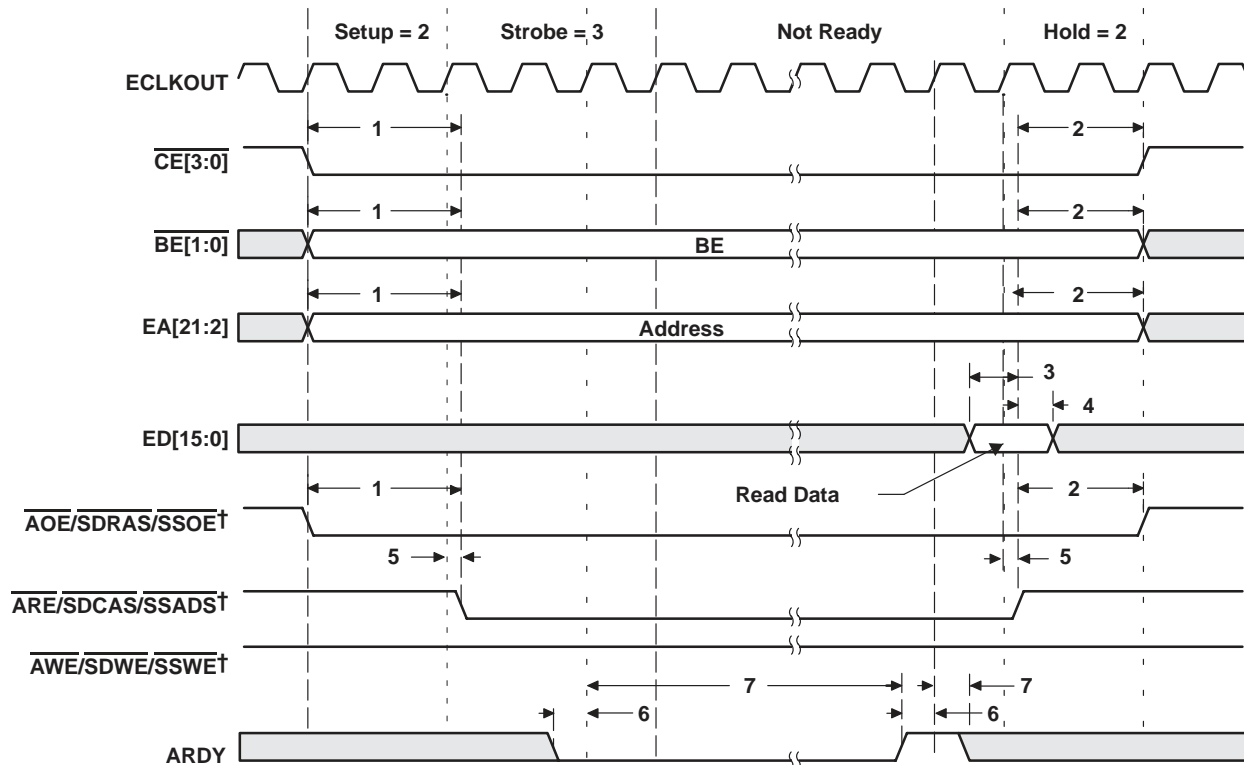

<sup>†</sup> RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.

<sup>§</sup> E = ECLKOUT period in ns

<sup>¶</sup> Select signals include:  $\overline{\text{CE}}[3:0]$ ,  $\overline{\text{BE}}[1:0]$ , EA[21:2], and  $\overline{\text{AOE}}$ .

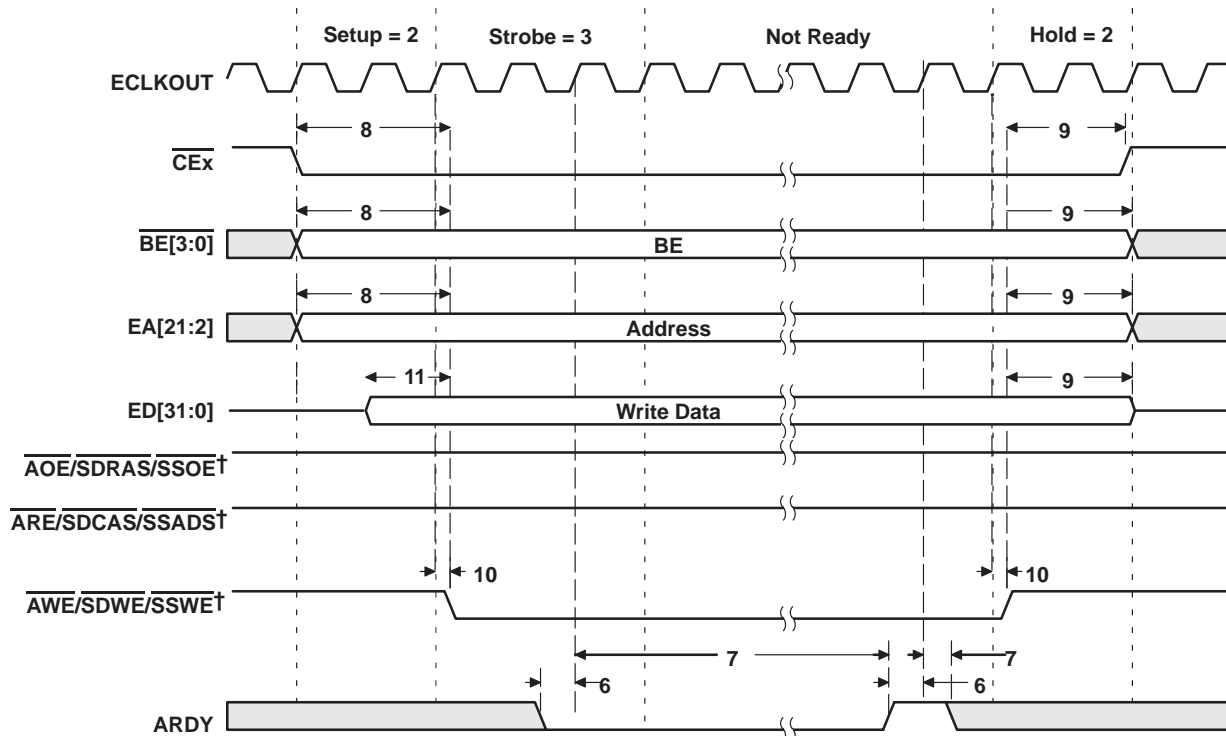

ASYNCHRONOUS MEMORY TIMING (CONTINUED)

†  $\overline{\text{AOE}}/\text{SDRAS}/\text{SSOE}$ ,  $\overline{\text{ARE}}/\text{SDCAS}/\text{SSADS}$ , and  $\overline{\text{AWE}}/\text{SDWE}/\text{SSWE}$  operate as  $\overline{\text{AOE}}$  (identified under select signals),  $\overline{\text{ARE}}$ , and  $\overline{\text{AWE}}$ , respectively, during asynchronous memory accesses.

Figure 28. Asynchronous Memory Read Timing

ASYNCHRONOUS MEMORY TIMING (CONTINUED)

†  $\overline{AOE}/\overline{SDRAS}/\overline{SSOE}$ ,  $\overline{ARE}/\overline{SDCAS}/\overline{SSADS}$ , and  $\overline{AWE}/\overline{SDWE}/\overline{SSWE}$  operate as  $\overline{AOE}$  (identified under select signals),  $\overline{ARE}$ , and  $\overline{AWE}$ , respectively, during asynchronous memory accesses.

Figure 29. Asynchronous Memory Write Timing

**SYNCHRONOUS-BURST MEMORY TIMING**

**timing requirements for synchronous-burst SRAM cycles<sup>†</sup> (see Figure 30)**

NO.		-100		-167		UNIT
		MIN	MAX	MIN	MAX	
6	$t_{su}(EDV-EKOH)$ Setup time, read EDx valid before ECLKOUT high	6		1.5		ns

RESET TIMING [C6712]

timing requirements for reset<sup>†</sup> (see Figure 41)

NO.			-100		UNIT
			MIN	MAX	
1	t <sub>w</sub> (RST)	Width of the $\overline{\text{RESET}}$ pulse (PLL stable) <sup>‡</sup>	10P		ns
		Width of the $\overline{\text{RESET}}$ pulse (PLL needs to sync up) <sup>§</sup>	250		μs
14	t <sub>su</sub> (BOOT)	Setup time, BOOTMODE[1:0] configuration bits valid before $\overline{\text{RESET}}$ high	2P		ns
15	t <sub>h</sub> (BOOT)	Hold time, BOOTMODE[1:0] configuration bits valid after $\overline{\text{RESET}}$ high	2P		ns

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 100 MHz, use P = 10 ns.

<sup>‡</sup> This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x4 when CLKIN and PLL are stable.

<sup>§</sup> This parameter applies to CLKMODE x4 only (it does not apply to CLKMODE x1). The  $\overline{\text{RESET}}$  signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 μs to stabilize following device power up or after PLL configuration has been changed. During that time,  $\overline{\text{RESET}}$  must be asserted to ensure proper device operation. See the *clock PLL* section for PLL lock times.

<sup>¶</sup> P = 1/CPU clock frequency in ns.

Note that while internal reset is asserted low, the CPU clock (SYSCLK1) period is equal to the input clock (CLKIN) period multiplied by 8. For example, if the CLKIN period is 20 ns, then the CPU clock (SYSCLK1) period is 20 ns x 8 = 160 ns. Therefore, P = SYSCLK1 = 160 ns while internal reset is asserted.

<sup>#</sup> The internal reset is stretched exactly 512 x CLKIN cycles if CLKIN is used (CLKMODE0 = 1). If the input clock (CLKIN) is not stable when  $\overline{\text{RESET}}$  is deasserted, the actual delay time may vary.

<sup>||</sup> EMIF Z group consists of:  $\overline{\text{EA}}[21:2]$ ,  $\overline{\text{ED}}[15:0]$ ,  $\overline{\text{CE}}[3:0]$ ,  $\overline{\text{BE}}[1:0]$ ,  $\overline{\text{ARE}}/\overline{\text{SDCAS}}/\overline{\text{SSADS}}$ ,  $\overline{\text{AWE}}/\overline{\text{SDWE}}/\overline{\text{SSWE}}$ ,  $\overline{\text{AOE}}/\overline{\text{SDRAS}}/\overline{\text{SSOE}}$  and  $\overline{\text{HOLDA}}$

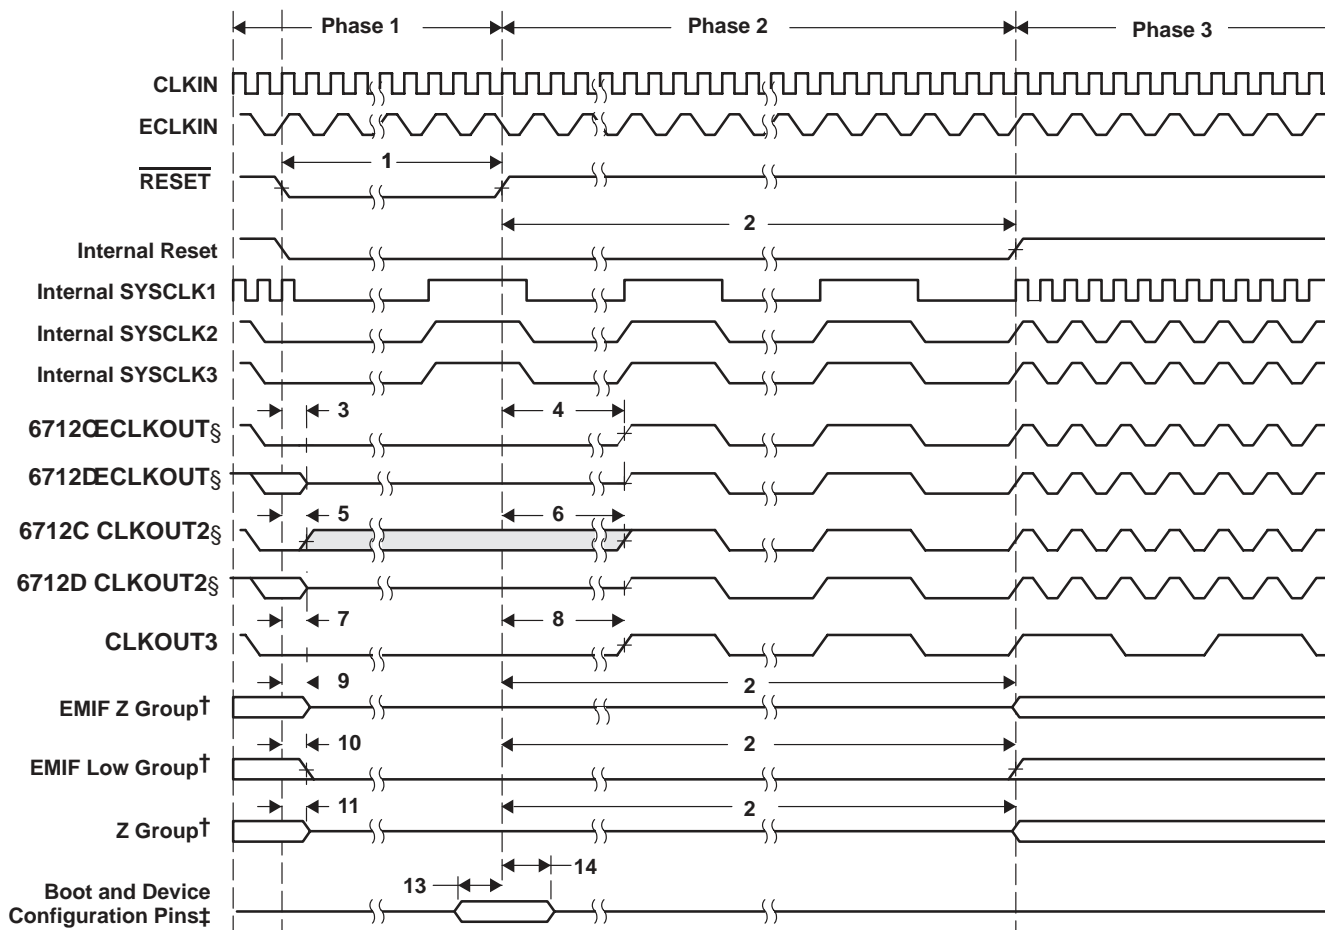

EMIF low group consists of: BUSREQ

Z group consists of: CLKR0, CLKR1, CLKX0, CLKX1, FSR0, FSR1, FSX0, FSX1, DX0, DX1, TOUT0, and TOUT1.

SGUS055 – SEPTEMBER 2004

## RESET TIMING [C6712C/C6712D] (CONTINUED)

† EMIF Z group consists of: EA[21:2], ED[15:0], CE[3:0], BE[1:0], ARE/SDCAS/SSADS, AWE/SDWE/SSWE, AOE/SDRAS/SSOE and HOLDA

EMIF low group consists of: BUSREQ

Z group consists of: CLKR0, CLKR1, CLKX0, CLKX1, FSR0, FSR1, FSX0, FSX1, DX0, DX1, TOUT0, and TOUT1.

‡ Boot and device configurations consist of: BOOTMODE[1:0] and LENDIAN.

**Figure 42. Reset Timing [C6712C/12D]**

**Reset Phase 1:** The  $\overline{\text{RESET}}$  pin is asserted. During this time, all internal clocks are running at the CLKIN frequency divide-by-8. The CPU is also running at the CLKIN frequency divide-by-8.

**Reset Phase 2:** The  $\overline{\text{RESET}}$  pin is deasserted but the internal reset is stretched. During this time, all internal clocks are running at the CLKIN frequency divide-by-8. The CPU is also running at the CLKIN frequency divide-by-8.

**Reset Phase 3:** Both the  $\overline{\text{RESET}}$  pin and internal reset are deasserted. During this time, all internal clocks are running at their default divide-down frequency of CLKIN. The CPU clock (SYSCLK1) is running at CLKIN frequency. The peripheral clock (SYSCLK2) is running at CLKIN frequency divide-by-2. The EMIF internal clock source (SYSCLK3) is running at CLKIN frequency divide-by-2. SYSCLK3 is reflected on the ECLKOUT pin (when EKSRC bit = 0 [default]). CLKOUT3 is running at CLKIN frequency divide-by-8.

11	$t_h(\text{CKXL-FXH})$	Hold time, external FSX high after CLKX low	CLKX int	6	ns
			CLKX ext	3	

† CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

‡ P = 1/CPU clock frequency in ns. For example, when running parts at 100 MHz, use P = 10 ns.

§ The minimum CLKR/X period is twice the CPU cycle time (2P). This means that the maximum bit rate for communications between the McBSP and other device is 50 Mbps for 100 MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 33 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 30 ns (33 MHz), whichever value is larger. For example, when running parts at 100 MHz (P = 10 ns), use 30 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

**MULTICHANNEL BUFFERED SERIAL PORT TIMING (CONTINUED)**

**timing requirements for McBSP<sup>†‡</sup> (see Figure 44) [C6712C/C6712D]**

NO.			-167		UNIT
			MIN	MAX	
2	$t_c(\text{CKRX})$	Cycle time, CLKR/X	CLKR/X ext	2P <sup>§</sup>	ns
3	$t_w(\text{CKRX})$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	$0.5 * t_c(\text{CKRX}) - 1$ <sup>¶</sup>	ns
5	$t_{su}(\text{FRH-CKRL})$	Setup time, external FSR high before CLKR low	CLKR int	9	ns
			CLKR ext	1	
6	$t_h(\text{CKRL-FRH})$	Hold time, external FSR high after CLKR low	CLKR int	6	ns
			CLKR ext	3	
7	$t_{su}(\text{DRV-CKRL})$	Setup time, DR valid before CLKR low	CLKR int	8	ns
			CLKR ext	0	
8	$t_h(\text{CKRL-DRV})$	Hold time, DR valid after CLKR low	CLKR int	3	ns
			CLKR ext	4	
10	$t_{su}(\text{FXH-CKXL})$	Setup time, external FSX high before CLKX low	CLKX int	9	ns
			CLKX ext	1	
11	$t_h(\text{CKXL-FXH})$	Hold time, external FSX high after CLKX low	CLKX int	6	ns
			CLKX ext	3	

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 167 MHz, use P = 6 ns.

<sup>§</sup> The minimum CLKR/X period is twice the CPU cycle time (2P) and not faster than 75 Mbps (13.3 ns). This means that the maximum bit rate for communications between the McBSP and other device is 75 Mbps for 150 MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 67 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 15 ns (67 MHz), whichever value is larger. For example, when running parts at 150 MHz (P = 6.7 ns), use 15 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

<sup>¶</sup> This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

			CLKX ext 3 + D1 <sup>  </sup> 19 + D2 <sup>  </sup>		
14	$t_d(\text{FXH-DXV})$	Delay time, FSX high to DX valid ONLY applies when in data delay 0 (XDATDLY = 00b) mode	FSX int -1 3		ns
			FSX ext 3 9		

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> Minimum delay times also represent minimum output hold times.

<sup>§</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 100 MHz, use P = 10 ns.

<sup>¶</sup> The minimum CLKR/X period is twice the CPU cycle time (2P). This means that the maximum bit rate for communications between the McBSP and other device is 50 Mbps for 100 MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 33 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 30 ns (33 MHz), whichever value is larger. For example, when running parts at 100 MHz (P = 10 ns), use 30 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

<sup>#</sup> C = H or L

S = sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P\_clks if CLKSM = 0 (P\_clks = CLKS period)

H = CLKX high pulse width = (CLKGDV/2 + 1) \* S if CLKGDV is even  
= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) \* S if CLKGDV is even  
= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see <sup>¶</sup> footnote above).

<sup>||</sup> Extra delay from CLKX high to DX valid applies *only* to the first data bit of a device, if and only if DXENA = 1 in SPCR.

If DXENA = 0, then D1 = D2 = 0

If DXENA = 1, then D1 = 2P, D2 = 4P

			FSX ext	2	9	2	11.5	

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> Minimum delay times also represent minimum output hold times.

<sup>§</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 167 MHz, use P = 6 ns.

<sup>¶</sup> The minimum CLKR/X period is twice the CPU cycle time (2P) and not faster than 75 Mbps (13.3 ns). This means that the maximum bit rate for communications between the McBSP and other device is 75 Mbps for 150 MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 67 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 15 ns (67 MHz), whichever value is larger. For example, when running parts at 150 MHz (P = 6.7 ns), use 15 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

<sup>#</sup> C = H or L

S = sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P\_clks if CLKSM = 0 (P\_clks = CLKS period)

H = CLKX high pulse width = (CLKGDV/2 + 1) \* S if CLKGDV is even

## MULTICHANNEL BUFFERED SERIAL PORT TIMING (CONTINUED)

timing requirements for McBSP as SPI master or slave: CLKSTP = 11b, CLKXP = 1†‡ (see Figure 49) [C6712]

NO.		-100				UNIT
		MASTER		SLAVE		
		MIN	MAX	MIN	MAX	
4	t <sub>su</sub> (DRV-CKXH) Setup time, DR valid before CLKX high	26		2 – 6P		ns
5	t <sub>h</sub> (CKXH-DRV) Hold time, DR valid after CLKX high	4		6 + 12P		ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 100 MHz, use P = 10 ns.

‡ For all SPI slave modes, CLKG is programmed as 1/2 of the CPU clock by setting CLKSM = CLKGDV = 1.

timing requirements for McBSP as SPI master or slave: CLKSTP = 11b, CLKXP = 1†‡ (see Figure 49) [C6712C/C6712D]

NO.		-167				UNIT
		MASTER		SLAVE		
		MIN	MAX	MIN	MAX	
4	t <sub>su</sub> (DRV-CKXH) Setup time, DR valid before CLKX high	12		2 – 6P		ns
5	t <sub>h</sub> (CKXH-DRV) Hold time, DR valid after CLKX high	4		5 + 12P		ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 167 MHz, use P = 6 ns.

‡ For all SPI slave modes, CLKG is programmed as 1/2 of the CPU clock by setting CLKSM = CLKGDV = 1.

switching characteristics over recommended operating conditions for McBSP as SPI master or slave: CLKSTP = 11b, CLKXP = 1†‡ (see Figure 49) [C6712]

NO.	PARAMETER	-100				UNIT
		MASTER <sup>§</sup>		SLAVE		
		MIN	MAX	MIN	MAX	
1	t <sub>h</sub> (CKXH-FXL) Hold time, FSX low after CLKX high†¶	H – 9	H + 9			ns
2	t <sub>d</sub> (FXL-CKXL) Delay time, FSX low to CLKX low <sup>#</sup>	T – 9	T + 9			ns
3	t <sub>d</sub> (CKXH-DXV) Delay time, CLKX high to DX valid	–9	9	6P + 4	10P + 20	ns
6	t <sub>dis</sub> (CKXH-DXHZ) Disable time, DX high impedance following last data bit from CLKX high	–9	9	6P + 3	10P + 20	ns
7	t <sub>d</sub> (FXL-DXV) Delay time, FSX low to DX valid	L – 9	L + 9	4P + 2	8P + 20	ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 100 MHz, use P = 10 ns.

‡ For all SPI slave modes, CLKG is programmed as 1/2 of the CPU clock by setting CLKSM = CLKGDV = 1.

§ S = Sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= Sample rate generator input clock = P\_clks if CLKSM = 0 (P\_clks = CLKS period)

T = CLKX period = (1 + CLKGDV) \* S

H = CLKX high pulse width = (CLKGDV/2 + 1) \* S if CLKGDV is even

= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) \* S if CLKGDV is even

= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

¶ FSRP = FSXP = 1. As a SPI master, FSX is inverted to provide active-low slave-enable output. As a slave, the active-low signal input on FSX and FSR is inverted before being used internally.

CLKXM = FSXM = 1, CLKRM = FSRM = 0 for master McBSP

CLKXM = CLKRM = FSXM = FSRM = 0 for slave McBSP

# FSX should be low before the rising edge of clock to enable slave devices and then begin a SPI transfer at the rising edge of the master clock (CLKX).

**MULTICHANNEL BUFFERED SERIAL PORT TIMING (CONTINUED)**

## TIMER TIMING

timing requirements for timer inputs† (see Figure 50)

NO.		-100 -167		UNIT
		MIN	MAX	
1	$t_w(\text{TINPH})$ Pulse duration, TINP high	2P		ns
2	$t_w(\text{TINPL})$ Pulse duration, TINP low	2P		ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 100 MHz, use P = 10 ns.

switching characteristics over recommended operating conditions for timer outputs† (see Figure 50)

NO.	PARAMETER	-100 -167		UNIT
		MIN	MAX	
3	$t_w(\text{TOUTH})$ Pulse duration, TOUT high	4P-3		ns
4	$t_w(\text{TOU TL})$ Pulse duration, TOUT low	4P-3		ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 100 MHz, use P = 10 ns.

Figure 50. Timer Timing

GENERAL-PURPOSE INPUT/OUTPUT (GPIO) PORT TIMING [C6712C/C6712D ONLY]

timing requirements for GPIO inputs<sup>†‡</sup> (see Figure 51)

NO.		-167		UNIT
		MIN	MAX	
1	$t_w(\text{GPIH})$ Pulse duration, GPIx high	4P		ns
2	$t_w(\text{GPI L})$ Pulse duration, GPIx low	4P		ns

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 167 MHz, use P = 6 ns.

<sup>‡</sup> The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the DSP recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to at least 24P to allow the DSP enough time to access the GPIO register through the CFGBUS.

switching characteristics over recommended operating conditions for GPIO outputs<sup>†§</sup>  
 (see Figure 51)

NO.	PARAMETER	-167		UNIT
		MIN	MAX	
3	$t_w(\text{GPOH})$ Pulse duration, GPOx high	12P – 3		ns
4	$t_w(\text{GPO L})$ Pulse duration, GPOx low	12P – 3		ns

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 167 MHz, use P = 6 ns.

<sup>§</sup> The number of CFGBUS cycles between two back-to-back CFGBUS writes to the GPIO register is 12 SYSCLK1 cycles; therefore, the minimum GPOx pulse width is 12P.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TRAY**

Chamfer on Tray corner indicates Pin 1 orientation of packed units.
