
8 MHz 400 mA Internal Inductor Buck Regulator with HyperLight Load[®]

Features

- Internal Inductor
 - Simplifies Design to Two External Capacitors
- Input Voltage: 2.7V to 5.5V
- Output Voltage Accuracy of $\pm 2.5\%$ over Temperature
- 400 mA Output Current
- Efficiency up to 78% at 1 mA
- 21 μA Typical Quiescent Current
- Up to 8 MHz PWM Operation in Continuous Mode
- Ultra-Fast Transient Response
- Low Voltage Output Ripple
 - 30 mV_{PP} Ripple in HyperLight Load[®] Mode
 - 7 mV Output Voltage Ripple in Full PWM Mode
- Fully Integrated MOSFET Switches
- 0.01 μA Shutdown Current
- Thermal Shutdown and Current-Limit Protection
- Fixed and Adjustable Output Voltage Options Available (0.7V to 3.6V)
- 2.5 mm x 2.0 mm 10-Lead HJDFN Package
- -40°C to $+125^{\circ}\text{C}$ Junction Temperature Range

Applications

- Mobile Handsets
- Portable Media/MP3 Players
- Portable Navigation Devices (GPS)
- WiFi/WiMax/WiBro Modules
- Digital Cameras
- Wireless LAN Cards
- USB-Powered Devices
- Portable Applications

General Description

The MIC33030 is a high-efficiency, 8 MHz 400 mA synchronous buck regulator with an internal inductor and HyperLight Load[®] mode. HyperLight Load[®] provides very high efficiency at light loads and ultra-fast transient response that is perfectly suited for supplying processor core voltages.

An additional benefit of this proprietary architecture is the very low output ripple voltage throughout the entire load range with the use of small output capacitors. The tiny 2.5 mm x 2.0 mm HJDFN package saves precious board space and requires only two external capacitors.

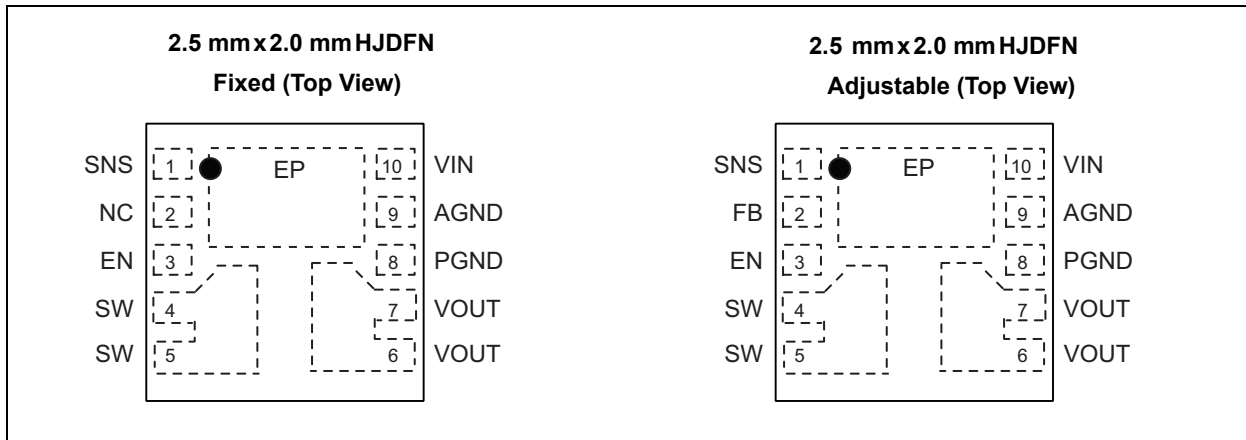

The MIC33030 is designed for use with tiny output capacitors as small as 2.2 μF . This gives the MIC33030 the ease of use of an LDO with the efficiency of a HyperLight Load[®] DC converter.

The MIC33030 achieves efficiency in HyperLight Load[®] mode as high as 78% at 1 mA, with a very low quiescent current of 21 μA . At higher loads, the MIC33030 provides a constant switching frequency up to 8 MHz.

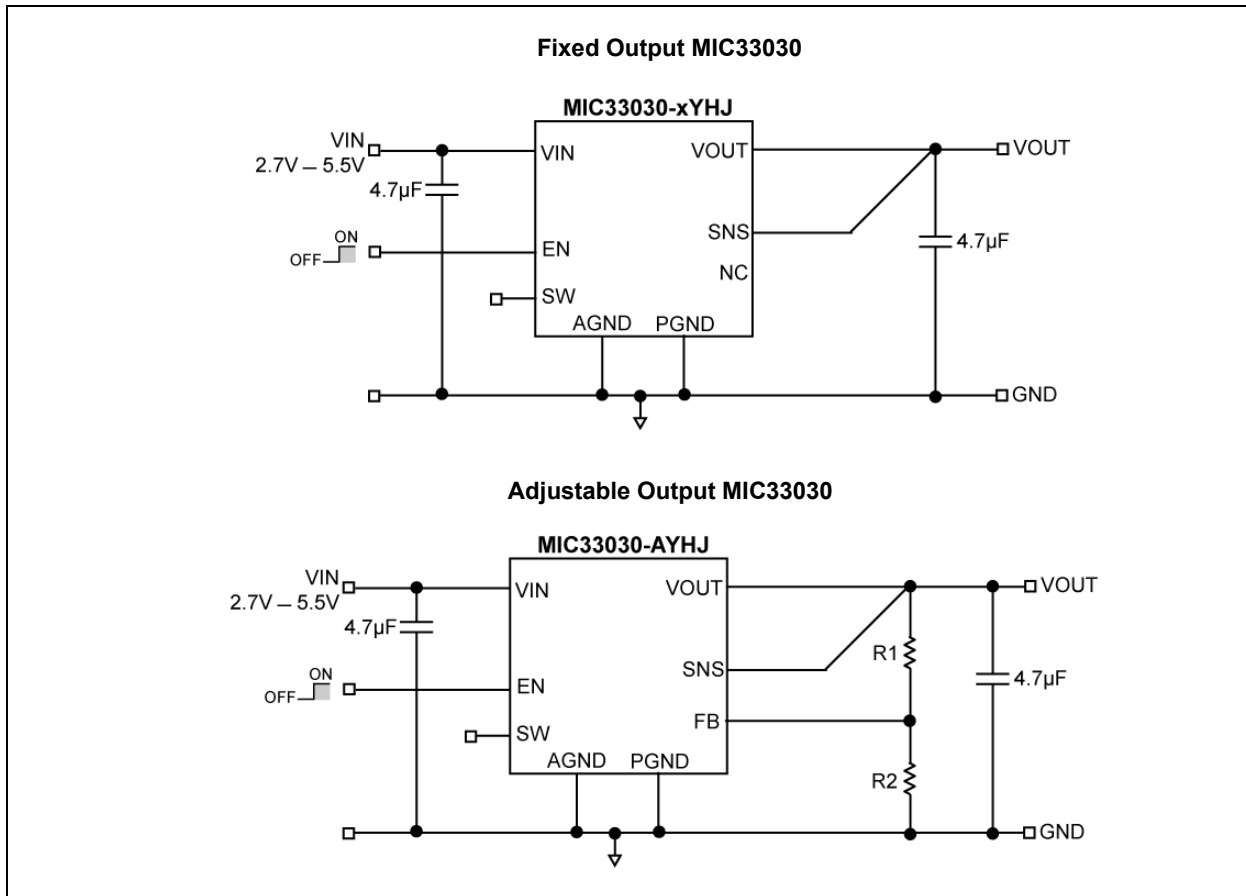

The MIC33030 is available in a 10-lead 2.5 mm x 2.0 mm HJDFN package with an operating junction temperature range of -40°C to $+125^{\circ}\text{C}$.

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Supply Voltage (V_{IN}).....	-0.3V to +6V
Sense (V_{SNS})	-0.3V to +6V
Output Switch Voltage	-0.3V to +6V
Enable Input Voltage (V_{EN})	-0.3V to V_{IN}
ESD Rating (Note 1).....	ESD Sensitive

Operating Ratings ‡

Supply Voltage (V_{IN}).....	+2.7V to +5.5V
Enable Input Voltage (V_{EN})	0V to V_{IN}
Output Voltage (V_{OUT}).....	+0.7V to +3.6V

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability. Specifications are for packaged product only.

‡ **Notice:** The device is not guaranteed to function outside its operating ratings.

Note 1: Devices are ESD sensitive. Handling precautions are recommended. Human body model, 1.5 k Ω in series with 100 pF.

ELECTRICAL CHARACTERISTICS

Electrical Characteristics: $T_A = 25^\circ\text{C}$, $V_{IN} = V_{EN} = 3.6\text{V}$; $C_{OUT} = 4.7\mu\text{F}$; **Bold** values indicate $-40^\circ\text{C} \leq T_J \leq +125^\circ\text{C}$; unless otherwise specified. Specification for packaged product only.

TEMPERATURE SPECIFICATIONS (Note 1)

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Temperature Ranges						
Junction Operating Temperature Range	T_J	-40	—	+125	°C	—
Storage Temperature Range	T_S	-65	—	+150	°C	—
Package Thermal Resistances						
Thermal Resistance HJDFN 2.5 mm x 2.0 mm	θ_{JA}	—	76	—	°C/W	—
Thermal Resistance HJDFN 2.5 mm x 2.0 mm	θ_{JC}	—	45	—	°C/W	—

Note 1: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., T_A , T_J , θ_{JA}). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

TABLE 3-1: PIN FUNCTION TABLE

Pin Number MIC33030 (Fixed Option)	Pin Number MIC33030 (ADJ Option)	Pin Name	Description
1	1	SNS	Sense: Connect to V_{OUT} as close to output capacitor as possible to sense output voltage.
2	—	NC	Not internally connected.
—	2	FB	Feedback: Connect resistor divider at this node to set output voltage. Resistors should be selected based on a nominal $V_{FB} = 0.62V$.
3	3	EN	Enable: Logic high enables operation of the regulator. Logic low will shut down the device. Do not leave floating.
4, 5	4, 5	SW	Switch: Internal power MOSFET output switches.
6, 7	6, 7	VOUT	Output Voltage: The output of the regulator. Connect to SNS pin. For adjustable option, connect to feedback resistor network.
8	8	PGND	Power Ground.
9	9	AGND	Analog Ground.
10	10	VIN	Input Voltage: Connect a capacitor to ground to decouple the noise.
ePAD	ePAD	HS PAD	Connect to PGND or AGND.

MIC33030

4.0 FUNCTIONAL DESCRIPTION

4.1 VIN

The input supply (V_{IN}) provides power to the internal MOSFETs for the switch mode regulator along with the internal control circuitry. The V_{IN} operating range is 2.7V to 5.5V, so an input capacitor with a minimum voltage rating of 6.3V is recommended. Due to the high switching speed, a minimum 2.2 μF bypass capacitor placed close to V_{IN} and the power ground (PGND) pin is required.

4.2 EN

A logic high signal on the enable pin activates the output voltage of the device. A logic low signal on the enable pin deactivates the output and reduces supply current to 0.01 μA . The MIC33030 features built in soft-start circuitry that reduces in-rush current and prevents the output voltage from overshooting at start up. Do not leave the enable pin floating.

4.3 SW

The switch (SW) connects directly to one end of the internal inductor and provides the current path during switching cycles. The other end of the inductor is connected to the load, SNS pin and output capacitor. Because the MIC33030 has an internal inductor, this pin is not routed in most applications.

4.4 VOUT

The output pin (V_{OUT}) is the output voltage pin following the internal inductor. Connect a minimum of 2.2 μF output filter capacitor to this pin.

4.5 SNS

The sense (SNS) pin is connected to the output of the device to provide feedback to the control circuitry. The SNS connection should be placed close to the output capacitor.

4.6 AGND

The analog ground (AGND) is the ground path for the biasing and control circuitry. The current loop for the signal ground should be separate from the power ground (PGND) loop.

4.7 FB (Adjustable Output Only)

The feedback pin (FB) allows the regulated output voltage to be set by applying an external resistor network. The internal reference voltage is 0.62V and the recommended value of R2 is 200 k Ω . The output voltage is calculated from the equation below:

EQUATION 4-1:

$$V_{OUT} = 0.62V \left(\frac{R1}{200k\Omega} + 1 \right)$$

FIGURE 4-1: MIC33030-AYHJ Schematic.

4.8 PGND

The power ground pin is the ground path for the high current in PWM mode. The current loop for the power ground should be as small as possible and separate from the analog ground (AGND) loop as applicable.

5.0 APPLICATION INFORMATION

The MIC33030 is a high-performance DC/DC step down regulator that offers a small solution size. Supporting an output current up to 400 mA inside a tiny 2.5 mm x 2.0 mm HJDFN package and requiring only two external components, the MIC33030 meets today's miniature portable electronic device needs. Using the HyperLight Load[®] switching scheme, the MIC33030 is able to maintain high efficiency throughout the entire load range while providing ultra-fast load transient response. The following sections provide additional device application information.

5.1 Input Capacitor

A 2.2 μF ceramic capacitor or greater should be placed close to the VIN pin and PGND pin for bypassing. A TDK C1608X5R0J475K, size 0603, 4.7 μF ceramic capacitor is recommended based upon performance, size and cost. A X5R or X7R temperature rating is recommended for the input capacitor. Y5V temperature rating capacitors, aside from losing most of their capacitance over temperature, can also become resistive at high frequencies. This reduces their ability to filter out high frequency noise.

5.2 Output Capacitor

The MIC33030 is designed for use with a 2.2 μF or greater ceramic output capacitor. Increasing the output capacitance will lower output ripple and improve load transient response but could increase solution size or cost. A low equivalent series resistance (ESR) ceramic output capacitor such as the TDK C1608X5R0J475K, size 0603, 4.7 μF ceramic capacitor is recommended based upon performance, size and cost. Both the X7R or X5R temperature rating capacitors are recommended. The Y5V and Z5U temperature rating capacitors are not recommended due to their wide variation in capacitance over temperature and increased resistance at high frequencies.

5.3 Compensation

The MIC33030 is designed to be stable with a minimum of 2.2 μF ceramic (X5R) output capacitor.

5.4 Duty Cycle

The typical maximum duty cycle of the MIC33030 is 90%.

5.5 Efficiency Considerations

Efficiency is defined as the amount of useful output power, divided by the amount of power supplied.

EQUATION 5-1:

$$\eta = \left(\frac{V_{OUT} \times I_{OUT}}{V_{IN} \times I_{IN}} \right) \times 100$$

Maintaining high efficiency serves two purposes. It reduces power dissipation in the power supply, reducing the need for heat sinks and thermal design considerations and it reduces consumption of current for battery powered applications. Reduced current draw from a battery increases the devices operating time which is critical in hand held devices.

There are two types of losses in switching converters; DC losses and switching losses. DC losses are simply the power dissipation of I^2R . Power is dissipated in the high-side switch during the on cycle. Power loss is equal to the high-side MOSFET $R_{DS(ON)}$ multiplied by the switch current squared. During the off cycle, the low-side N-channel MOSFET conducts, also dissipating power. Device operating current also reduces efficiency. The product of the quiescent (operating) current and the supply voltage represents another DC loss. The current required driving the gates on and off at a constant 8 MHz frequency and the switching transitions make up the switching losses.

FIGURE 5-1: Efficiency under Load.

Figure 5-1 shows an efficiency curve. From no load to 100 mA, efficiency losses are dominated by quiescent current losses, gate drive and transition losses. By using the HyperLight Load[®] mode, the MIC33030 is able to maintain high efficiency at low output currents.

Over 100 mA, efficiency loss is dominated by MOSFET $R_{DS(ON)}$ and inductor losses. Higher input supply voltages will increase the gate to source threshold on the internal MOSFETs, thereby reducing the internal

MIC33030

$R_{DS(ON)}$. This improves efficiency by reducing DC losses in the device. All but the inductor losses are inherent to the device. In which case, inductor selection becomes increasingly critical in efficiency calculations. As the inductors are reduced in size, the DC resistance (DCR) can become quite significant.

The DCR losses can be calculated by using Equation 5-2:

EQUATION 5-2:

$$P_{DCR} = I_{OUT}^2 \times DCR$$

From that, the loss in efficiency due to inductor resistance can be calculated by using Equation 5-3:

EQUATION 5-3:

$$EfficiencyLoss = \left[1 - \left(\frac{V_{OUT} \times I_{OUT}}{V_{OUT} \times I_{OUT} + P_{DCR}} \right) \right] \times 100$$

Efficiency loss due to DCR is minimal at light loads and gains significance as the load is increased. Inductor selection becomes a trade-off between efficiency and size in this case.

The effect of MOSFET voltage drops and DCR losses in conjunction with the maximum duty cycle combine to limit maximum output voltage for a given input voltage. Figure 5-2 shows this relationship based on the typical resistive losses in the MIC33030:

FIGURE 5-2: $V_{OUT(MAX)}$ vs. V_{IN}

5.6 HyperLight Load® Mode

MIC33030 uses a minimum on-time and off-time proprietary control loop. When the output voltage falls below the regulation threshold, the error comparator begins a switching cycle that turns the PMOS on and keeps it on for the duration of the minimum-on-time. This increases the output voltage.

If the output voltage is over the regulation threshold, then the error comparator turns the PMOS off for a minimum off-time until the output drops below the threshold. The NMOS acts as an ideal rectifier that conducts when the PMOS is off. Using a NMOS switch instead of a diode allows for lower voltage drop across the switching device when it is on.

The asynchronous switching combination between the PMOS and the NMOS allows the control loop to work in discontinuous mode for light load operations. In discontinuous mode, the MIC33030 works in pulse frequency modulation (PFM) to regulate the output. As the output current increases, the off-time decreases, thus provides more energy to the output.

This switching scheme improves the efficiency of MIC33030 during light load currents by only switching when it is needed. As the load current increases, the MIC33030 goes into continuous conduction mode (CCM) and switches at a frequency centered at 8 MHz. The equation to calculate the load when the MIC33030 goes into continuous conduction mode may be approximated by the following Equation 5-4:

EQUATION 5-4:

$$I_{LOAD} > \frac{(V_{IN} - V_{OUT}) \times D}{2L \times f}$$

The load at which MIC33030 transitions from HyperLight Load® mode to PWM mode is a function of the input voltage (V_{IN}), output voltage (V_{OUT}), duty cycle (D), inductance (L), and frequency (f). Because the inductance of MIC33030 is 0.36 μ H, the device will enter HyperLight Load® mode or PWM mode at approximately 150 mA.

5.7 Power Dissipation Considerations

As with all power devices, the ultimate current rating of the output is limited by the thermal properties of the package and the PCB it is mounted on. There is a simple, ohms law type relationship between thermal resistance, power dissipation, and temperature which are analogous to an electrical circuit:

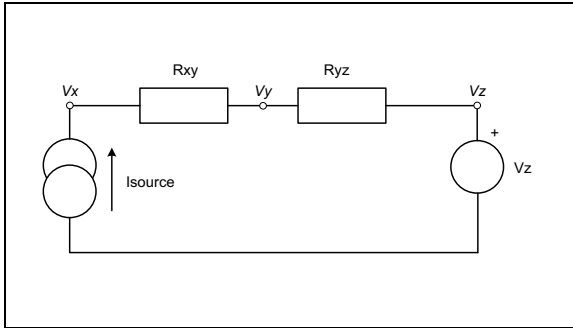

FIGURE 5-3:

From this simple circuit V_x can be calculated if I_{SOURCE} , V_z and the resistor values, R_{xy} and R_{yz} are known, using the [Equation 5-5](#):

EQUATION 5-5:

$$V_x = I_{SOURCE} \times (R_{XY} + R_{YZ}) + V_z$$

Thermal circuits can be considered using these same rules and can be drawn similarly replacing current sources with power dissipation (in Watts), resistance with thermal resistance (in °C/W) and voltage sources with temperature (in °C):

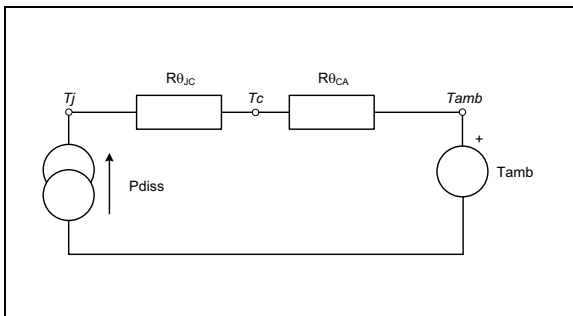

FIGURE 5-4:

Now replacing the variables in the equation for V_x , we can find the junction temperature (T_J) from power dissipation, ambient temperature and the known thermal resistance of the PCB ($R_{\theta_{CA}}$) and the package ($R_{\theta_{JC}}$):

EQUATION 5-6:

$$T_J = P_{DISS} \times (R_{\theta_{JC}} + R_{\theta_{CA}}) + T_{AMB}$$

As can be seen in [Figure 5-4](#), total thermal resistance $R_{\theta_{JA}} = R_{\theta_{JC}} + R_{\theta_{CA}}$. This can also be calculated using [Equation 5-6](#):

EQUATION 5-7:

$$T_J = P_{DISS} \times (R_{\theta_{JA}}) + T_{AMB}$$

Since effectively all of the power loss in the converter is dissipated within the MIC33030 package, P_{DISS} can be calculated by using [Equation 5-8](#):

EQUATION 5-8:

$$P_{DISS} = P_{OUT} \times \left(\frac{1}{\eta} - 1 \right)$$

Where:
 $\eta =$ Efficiency taken from Efficiency Curves

$R_{\theta_{JC}}$ and $R_{\theta_{JA}}$ are found in the operating ratings section of the data sheet.

EXAMPLE 5-1:

A MIC33030 is intended to drive a 300 mA load at 1.8V and is placed on a printed circuit board which has a ground plane area of at least 25 mm square. The voltage source is a Li-ion battery with a lower operating threshold of 3V and the ambient temperature of the assembly can be up to 50°C.

Summary of variables:

- $I_{OUT} = 0.3A$
- $V_{OUT} = 1.8V$
- $V_{IN} = 3V$ to $4.2V$
- $T_{AMB} = 50^\circ C$
- $R_{\theta_{JA}} = 76^\circ C/W$

$\eta @ 300\text{ mA} = 75\%$ (worst case with $V_{IN} = 4.2V$) See [Section 2.0, Typical Performance Curves](#).

MIC33030

EQUATION 5-9:

$$P_{DISS} = 1.8 \times 0.3 \times \left(\frac{1}{0.75} - 1 \right) = 0.18 W$$

The worst case switch and inductor resistance will increase at higher temperatures, so a margin of 20% can be added to account for this:

EQUATION 5-10:

$$P_{DISS} = 0.18 \times 1.2 = 0.216 W$$

Therefore:

$$T_J = 0.216 W \times (76^\circ C/W) + 50^\circ C$$

$$T_J = 66^\circ C$$

This is well below the maximum 125°C.

6.0 PACKAGING INFORMATION

6.1 Package Marking Information

NOTES:

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at <https://www.microchip.com/en-us/support/design-help/client-support-services>.

MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

For information regarding Microchip's Quality Management Systems, please visit www.microchip.com/quality.

Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AnyRate, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, CryptoMemory, CryptoRF, dsPIC, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Klear, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AgileSwitch, APT, ClockWorks, The Embedded Control Solutions Company, EtherSynch, Flashtec, Hyper Speed Control, HyperLight Load, IntelliMOS, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, QuietWire, SmartFusion, SyncWorld, Temux, TimeCesium, TimeHub, TimePictra, TimeProvider, TrueTime, WinPath, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, Augmented Switching, BlueSky, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, Espresso T1S, EtherGREEN, GridTime, IdealBridge, In-Circuit Serial Programming, ICSP, INICnet, Intelligent Paralleling, Inter-Chip Connectivity, JitterBlocker, Knob-on-Display, maxCrypto, maxView, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, NVM Express, NVMe, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, RTAX, RTG4, SAM-ICE, Serial Quad I/O, simpleMAP, SimpliPHY, SmartBuffer, SmartHLS, SMART-I.S., storClad, SQL, SuperSwitcher, SuperSwitcher II, Switchtec, SynchroPHY, Total Endurance, TSHARC, USBCheck, VariSense, VectorBlox, VeriPHY, ViewSpan, WiperLock, XpressConnect, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

The Adaptec logo, Frequency on Demand, Silicon Storage Technology, Symmcom, and Trusted Time are registered trademarks of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
