20 GHz to 42 GHz, Wideband I/Q Mixer

Data Sheet **HMC8192LG**

FEATURES

Passive, wideband I/Q mixer
RF and LO range: 20 GHz to 42 GHz
Wide IF bandwidth of dc to 5 GHz
Single-ended RF, LO, and IF
Conversion loss: 9 dB typical, 20 GHz to 32 GHz
Image rejection: 25 dBc typical, 20 GHz to 32 GHz
Noise figure: 12 dB typical
Input IP3 (downconverter): 24 dBm typical, 20 GHz to 32 GHz
Input P1dB (downconverter) compression: 17 dBm typical, 20 GHz to 32 GHz
Input IP2: 55 dBm typical, 20 GHz to 32 GHz
LO to RF isolation: 42 dB, 20 GHz to 32 GHz
LO to IFx isolation: 45 dB, 20 GHz to 32 GHz
RF to IF isolation: 35 dB, 20 GHz to 32 GHz
Amplitude balance: ±1 dB typical
Phase balance (downconverter): ±8° typical
RF return loss: 12 dB typical
LO return loss: 10 dB typical
IFx return loss: 20 dB typical
Exposed pad, 4.00 mm × 4.00 mm, 25-terminal LGA_CAV package

APPLICATIONS

Test and measurement instrumentation
Military, radar, aerospace, and defense applications
Microwave point to point base stations

FUNCTIONAL BLOCK DIAGRAM

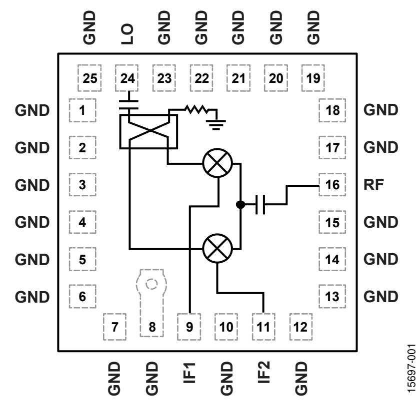

Figure 1.

GENERAL DESCRIPTION

The HMC8192LG is a passive, wideband, inphase/quadrature (I/Q), monolithic microwave integrated circuit (MMIC) mixer that can be used either as an image rejection mixer for receiver operations or as a single-sideband upconverter for transmitter operations. With a radio frequency (RF) and local oscillator (LO) range of 20 GHz to 42 GHz, and an intermediate frequency (IF) bandwidth of dc to 5 GHz, the HMC8192LG is ideal for applications requiring a wide frequency range, excellent RF performance, and a simple design with fewer components and a small printed circuit board (PCB) footprint. A single HMC8192LG can replace multiple narrow-band mixers in a design.

The inherent I/Q architecture of the HMC8192LG offers excellent image rejection, eliminating the need for expensive filtering for unwanted sidebands. The mixer also provides excellent LO to RF and LO to IF isolation and reduces the effect of LO leakage to ensure signal integrity.

As a passive mixer, the HMC8192LG does not require any dc power sources. The HMC8192LG offers a lower noise figure compared to an active mixer, ensuring superior dynamic range for high performance and precision applications.

The HMC8192LG is fabricated on a gallium arsenide (GaAs), metal semiconductor field effect transistor (MESFET) process and uses Analog Devices, Inc., mixer cells and a 90° hybrid. The HMC8192LG is available in a compact, 4.00 mm × 4.00 mm, 25-terminal land grid array cavity (LGA_CAV) package and operates over a −40°C to +85°C temperature range. The evaluation board for the HMC8192LG, EV1HMC8192LG, is also available on the Analog Devices website.

TABLE OF CONTENTS

REVISION HISTORY

11/2019—Revision 0: Initial Version

SPECIFICATIONS

20 GHz TO 32 GHz

T_A = 25°C, IF = 100 MHz, LO drive = 18 dBm, all measurements performed as downconverter with upper sideband selected, external 90° hybrid at the IFx ports, and LO amplifier in line with lab bench LO source, unless otherwise noted.

Table 1.

Parameter	Symbol	Min	Typ	Max	Unit
FREQUENCY					
Radio	RF	20		32	GHz
LO	f_{LO}	20		32	GHz
Intermediate	IF	dc		5	GHz
LO DRIVE LEVEL		16	18	20	dBm
RF PERFORMANCE AS DOWNCONVERTER					
Conversion Loss			9	10	dB
Image Rejection		15	25		dBc
Single-Sideband Noise Figure	SSB NF		12		dB
Input Third-Order Intercept	IP3	22	24		dBm
Input 1 dB Compression Point	P1dB		17		dBm
Input Second-Order Intercept	IP2		55		dBm
Amplitude Balance[1]			±1		dB
Phase Balance[1]			±8		Degrees
RF PERFORMANCE AS UPCONVERTER					
Conversion Loss			9		dB
Sideband Rejection			18		dBc
Input Third-Order Intercept	IP3		21		dBm
Input 1 dB Compression Point	P1dB		14		dBm
ISOLATION PERFORMANCE					
LO to RF		36	42		dB
LO to IFx[1]			45		dB
RF to IF[1]			35		dB
RETURN LOSS PERFORMANCE[1]					
RF			12		dB
LO			10		dB
IFx			20		dB

[1] Measurements taken without 90° hybrid at the IFx ports.

32 GHz TO 42 GHz

T_A = 25°C, IF = 100 MHz, LO drive = 18 dBm, all measurements performed as downconverter with upper sideband selected, external 90° hybrid at the IFx ports, and LO amplifier in line with lab bench LO source, unless otherwise noted.

Table 2.

Parameter	Symbol	Min	Typ	Max	Unit
FREQUENCY

ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
RF Input Power	23 dBm
LO Input Power	23 dBm
IF Input Power	23 dBm
IF Source/Sink Current	3 mA
Continuous Power Dissipation, P_{DISS} (T_A = 85°C, Derate 7.2 mW/°C Above 85°C)[1]	647 mW
Maximum Junction Temperature (T_J)	175°C
Lifetime at Maximum T_J	>1 × 10^6 hours
Moisture Sensitivity Level (MSL)[2]	3
Maximum Peak Reflow Temperature (MLS3)	260°C
Operating Temperature Range	−40°C to +85°C
Storage Temperature Range	−65°C to +150°C
Electrostatic Discharge Sensitivity	
Human Body Model	4000 V
Field Induced Charged Device Model	1250 V

[1] P_{DISS} is a theoretical number calculated by (T_J – 85°C)/$θ_{JC}$.
[2] Based on IPC/JEDEC J-STD-20 MSL classifications.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

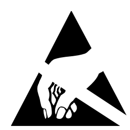
$θ_{JA}$ is the junction to ambient (or die to ambient) thermal resistance measured in a one cubic foot sealed enclosure, and $θ_{JC}$ is the junction to case (or die to package) thermal resistance.

Table 4. Thermal Resistance

Package Type	$θ_{JA}$	$θ_{JC}$	Unit
CE-25-1[1]	120	139	°C/W

[1] Thermal impedance simulated values are based on a JEDEC 2S2P test board with 4 × 4 thermal vias. Refer to JEDEC standard JESD51-2 for additional information.

ESD CAUTION



ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

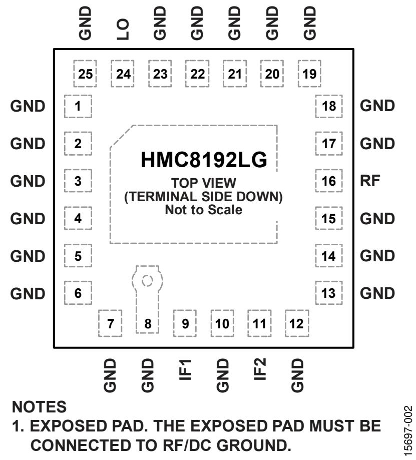


Figure 2. Pin Configuration

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Description
1 to 8, 10, 12 to 15, 17 to 23, 25	GND	Ground Connections. These pins and the package bottom must be connected to RF/dc ground. See Figure 3 for the interface schematic.
9, 11	IF1, IF2	First and Second Quadrature IF Input/Output Pins. These pins are dc-coupled. For applications not requiring operation to dc, use an off-chip dc blocking capacitor. For operations to dc, these pins must not source or sink more than 3 mA of current. Otherwise, the device may not function and may fail. See Figure 4 for the interface schematic.
16	RF	RF Input/Output. This pin is ac-coupled and matched to 50 Ω. See Figure 5 for the interface schematic.
24	LO	LO Input. This pin is ac-coupled and matched to 50 Ω. See Figure 6 for the interface schematic.
	EPAD	Exposed Pad. The exposed pad must be connected to RF/dc ground.

THEORY OF OPERATION

The HMC8192LG is a passive, wideband, I/Q MMIC mixer that can be used either as an image rejection mixer for receiver operations or as a single-sideband upconverter for transmitter operations. With an RF and LO range of 20 GHz to 42 GHz and an IF bandwidth of dc to 5 GHz, the HMC8192LG is ideal for applications requiring a wide frequency range, excellent RF performance, and a simple design with fewer components and a small PCB footprint. A single HMC8192LG can replace multiple narrow-band mixers in a design.

The inherent I/Q architecture of the HMC8192LG offers excellent image rejection, eliminating the need for expensive filtering for unwanted sidebands. The double balanced architecture of the mixer also provides excellent LO to RF isolation and LO to IF isolation, and reduces the effect of LO leakage to ensure signal integrity.

Because the HMC8192LG is a passive mixer, the HMC8192LG does not require any dc power sources. The HMC8192LG offers a lower noise figure compared to an active mixer, ensuring superior dynamic range for high performance and precision applications.

The HMC8192LG is fabricated on a GaAs MESFET process and uses Analog Devices mixer cells and a 90° hybrid. The HMC8192LG is available in a compact, 4.00 mm × 4.00 mm, 25-terminal LGA_CAV package and operates over a −40°C to +85°C temperature range. The evaluation board for the HMC8192LG, EV1HMC8192LG, is also available on the Analog Devices website.

For both upconversion and downconversion, an external 90° hybrid is required. See the Applications Information section for details on interfacing with an external 90° hybrid.

APPLICATIONS INFORMATION

Figure 121 shows the typical application circuit for the HMC8192LG. To select the appropriate sideband, an external 90° hybrid is needed. For applications not requiring operation to dc, use an off-chip dc blocking capacitor. For applications that require the LO signal at the output to be suppressed, use a bias tee or RF feed as shown in Figure 121. Ensure that the source or sink current used for LO suppression is greater than 3 mA for each IFx port to prevent damage to the device. The common-mode voltage for each IFx port is 0 V.

To select the upper sideband when using the HMC8192LG as an upconverter, connect the IF1 pin to the 90° port of the hybrid and connect the IF2 pin to the 0° port of the hybrid. To select the lower sideband, connect the IF1 pin to the 0° port of the hybrid and the IF2 pin to the 90° port of the hybrid. The input is from the sum port of the hybrid, and the difference port is 50 Ω terminated.

To select the upper sideband (low-side LO) when using the HMC8192LG as a downconverter, connect the IF1 pin to the 0° port of the hybrid and connect the IF2 pin to the 90° port of the hybrid. To select the lower sideband (high-side LO), connect the IF1 pin to the 90° port of the hybrid and the IF2 pin to the 0° port of the hybrid. The output is from the sum port of the hybrid, and the difference port is 50 Ω terminated.

LAYOUT

Solder the exposed pad on the underside of the HMC8192LG to a low thermal and electrical impedance ground plane. This pad is typically soldered to an exposed opening in the solder mask on the evaluation board. Connect these ground vias to all other ground layers on the evaluation board to maximize heat dissipation from the device package.

EVALUATION BOARD INFORMATION

The EV1HMC8192LG evaluation board PCB used in the application must use RF circuit design techniques. Signal lines must have a 50 Ω impedance and connect the package ground leads and exposed pad directly to the ground plane, similar to the setup shown in Figure 123. Use a sufficient number of via holes to connect the top and bottom ground planes.

PERFORMANCE AT LOWER IF FREQUENCIES

The HMC8192LG can operate at low IF frequencies approaching dc. Figure 124 shows the conversion gain and image rejection performance at lower IF frequencies for upconversion. Figure 125 shows the conversion gain and image rejection performance at lower IF frequencies for downconversion. This performance is typical and is not guaranteed.

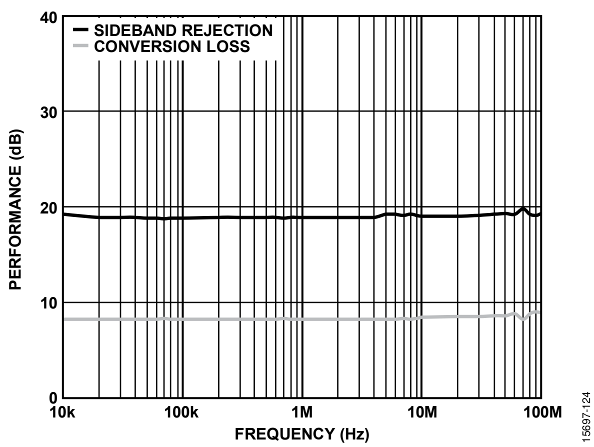

Figure 124. IF Bandwidth as Upconverter at Low IF Frequencies, LO = 25 GHz, 18 dBm, Upper Sideband

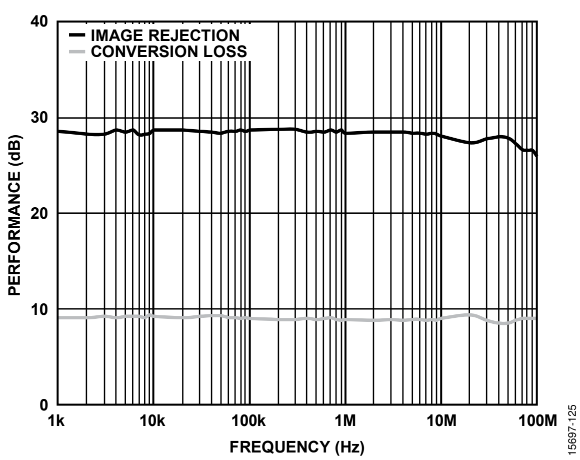

Figure 125. IF Bandwidth as Downconverter at Low IF Frequencies, LO = 25 GHz, 18 dBm, Upper Sideband

PERFORMANCE AT HIGHER IF FREQUENCIES

Figure 126 and Figure 127 show the IF performance above 5 GHz. The data for Figure 126 was taken as an upconverter configuration with a lower sideband at an LO frequency of 31 GHz and an LO power of 18 dBm. The data for Figure 127 was taken as a downconverter configuration with a lower sideband at an LO frequency of 31 GHz and an LO power of 18 dBm. This performance is typical and is not guaranteed.
