

## DESCRIPTION

Demonstration circuit 747 is a log-linear RF/IF detector featuring the LT<sup>®</sup>5537.

The LT5537 is a wide dynamic range RF/IF log detector, operational from below 10MHz to 1000MHz. The lower limit of the operating frequency range can be extended to near DC by the use of an external capacitor. The input dynamic range at 200MHz with  $\pm 3$ dB nonlinearity is 90dB (from  $-76$ dBm to 14dBm, single-

ended  $50\Omega$  input). The detector output voltage slope is normally 20mV/dB, and the typical temperature coefficient is 0.01dB/°C at 200MHz.

## QUICK START PROCEDURE

Demonstration circuit 747 is easy to set up to evaluate the performance of the LT5537. Refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

1. Connect voltmeter's negative (-) lead to demo board GND test point (E4 or E5).
2. Connect voltmeter's positive (+) lead to the demo board OUTPUT test point (E2).
3. Connect DC power supply's negative (-) output to demo board GND test point (E4 or E5).
4. Connect DC power supply's positive (+) output (2.7V to 5.25V) to demo board V<sub>CC</sub> test point (E3).

**NOTE:** Do not exceed 5.5V, the absolute maximum supply voltage.

5. Connect signal generator's output to demo board INPUT port (SMA connector J1) via coaxial cable. A 3dB attenuator may be inserted to improve input match.

6. Using a jumper cable, connect demo board V<sub>CC</sub> test point (E3) to ENBL test point (E1). Now the detector is enabled (on) and is ready for measurement.

**NOTE:** Make sure that the power is not applied to ENBL before it is applied to V<sub>CC</sub>. The voltages on the ENBL test point must never exceed V<sub>CC</sub> + 0.2V.

7. Apply RF input signal and measure OUTPUT DC voltages.

**NOTE:** Do not exceed +22dBm, the absolute maximum RF input power.
