## DS90C363/DS90CF364

DS90C363/DS90CF364 +3.3V Programmable LVDS 18-Bit-Color Flat Panel Display (FPD) Link - 65 MHz

# +3.3V Programmable LVDS Transmitter 18-Bit Flat Panel Display (FPD) Link - 65 MHz, +3.3V LVDS Receiver 18-Bit Flat Panel Display (FPD) Link - 65 MHz

### General Description

The DS90C363 transmitter converts 21 bits of CMOS/TTL data into three LVDS (Low Voltage Differential Signaling) data streams. A phase-locked transmit clock is transmitted in parallel with the data streams over a fourth LVDS link. Every cycle of the transmit clock 21 bits of input data are sampled and transmitted. The DS90CF364 receiver converts the LVDS data streams back into 21 bits of CMOS/TTL data. At a transmit clock frequency of 65 MHz, 18 bits of RGB data and 3 bits of LCD timing and control data (FPLINE, FPFRAME, DRDY) are transmitted at a rate of 455 Mbps per LVDS data channel. Using a 65 MHz clock, the data throughput is 170 Mbytes/sec. The Transmitter is offered with programmable edge data strobes for convenient interface with a variety of graphics controllers. The Transmitter can be programmed for Rising edge strobe or Falling edge strobe through a dedicated pin. A Rising edge Transmitter will interoperate with a Falling edge Receiver (DS90CF364) without any translation logic.

This chipset is an ideal means to solve EMI and cable size problems associated with wide, high speed TTL interfaces.

**Note 5:** Receiver Skew Margin is defined as the valid data sampling region at the receiver inputs. This margin takes into account the transmitter pulse positions (min and max) and the receiver input setup and hold time (internal data sampling window - RSPos). This margin allows for LVDS interconnect skew, inter-symbol interference (both dependent on type/length of cable), and clock jitter (less than 250 ps).

## Applications Information

The DS90C363 and DS90CF364 are backward compatible with the existing 5V FPD Link transmitter/receiver pair (DS90CF563 and DS90CF564). To upgrade from a 5V to a 3.3V system the following must be addressed:

1. Change 5V power supply to 3.3V. Provide this supply to the  $V_{CC}$ , LVDS  $V_{CC}$  and PLL  $V_{CC}$  of both the transmitter and receiver devices. This change may enable the removal of a 5V supply from the system, and power may be supplied from an existing 3V power source.
2. The DS90C363 (transmitter) incorporates a rise/fall strobe select pin. This select function is on pin 14, formerly a  $V_{CC}$  connection on the 5V products. When the rise/fall strobe select pin is connected to  $V_{CC}$ , the part is configured with a rising edge strobe. In a system currently using a 5V rising edge strobe transmitter

(DS90CF563), no layout changes are required to accommodate the new rise/fall select pin on the 3.3V transmitter. The  $V_{CC}$  signal may remain at pin 14, and the device will be configured with a rising edge strobe.

**When converting from a 5V falling edge transmitter (DS90CF563) to the 3V transmitter a minimal board layout change is necessary.** The 3.3V transmitter will not be configured with a falling edge strobe if  $V_{CC}$  remains connected to the select pin. To guarantee the 3.3V transmitter functions with a falling edge strobe pin 14 should be connected to ground OR left unconnected. When not connected (left open) and internal pull-down resistor ties pin 14 to ground, thus configuring the transmitter with a falling edge strobe.

3. The DS90C363 transmitter input and control inputs accept 3.3V TTL/CMOS levels. They are not 5V tolerant.
