NTAG 210µ, NFC Forum Type 2 Tag compliant IC with 48 bytes user memory

Rev. 3.0 — 7 September 2016 343930

Product data sheet COMPANY PUBLIC

1. Introduction

NXP Semiconductors developed the NTAG 210 μ as a standard NFC tag IC to be used in mass market applications such as retail, gaming and publishing. It is used in combination with NFC devices or NFC-compliant Proximity Coupling Devices. NTAG 210 μ is designed to comply fully with NFC Forum Type 2 Tag (<u>Ref. 2</u>) and ISO/IEC14443 Type A (<u>Ref. 1</u>) specifications.

Target applications include Out-of-Home and print media smart advertisement, SoLoMo applications, product authentication, NFC shelf labels, mobile companion tags and gaming.

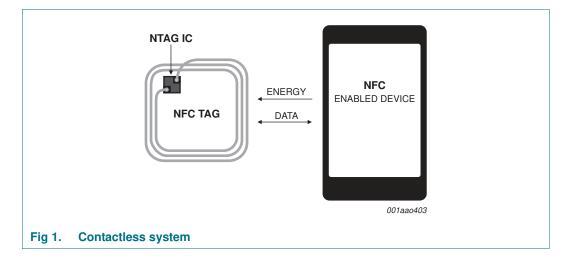

The mechanical and electrical specifications of NTAG 210μ are tailored to meet the requirements of inlay and tag manufacturers.

2. General description

2.1 Contactless energy and data transfer

Communication to NTAG 210 μ can be established only when the IC is connected to an antenna. Form and specification of the coil is out of scope of this document.

When NTAG 210 μ is positioned in the RF field, the high-speed RF communication interface allows the transmission of the data with a baud rate of 106 kbit/s.

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

2.2 Simple deployment and user convenience

NTAG 210 μ offers specific features designed to improve integration and user convenience:

- NTAG 210µ is available as 17 pF and 50 pF version
- The excellent RF performance allows for more flexibility in the choice of shape, dimension and materials
- The option for 75 μm IC thickness enables the manufacturing of ultrathin tags, for a more convenient integration in e.g. magazines or gaming cards.

2.3 Security

- · Manufacturer programmed 7-byte UID for each device
- · Pre-programmed Capability container with one time programmable bits
- · Field programmable read-only locking function per page
- Pre-programmed ECC-based originality signature, offering the possibility for customizing and permanently locking

2.4 NFC Forum Tag 2 Type compliance

NTAG 210µ IC provides full compliance to the NFC Forum Tag 2 Type technical specification (see <u>Ref. 2</u>) and enables NDEF data structure configurations (see <u>Ref. 3</u>).

2.5 Anticollision

An intelligent anticollision function allows more than one tag to operate in the field simultaneously. The anticollision algorithm selects each tag individually. It ensures that the execution of a transaction with a selected tag is performed correctly without interference from another tag in the field.

NT2L1001_NT2H1001

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

3. Features and benefits

- Contactless transmission of data and supply energy
- Operating frequency of 13.56 MHz
- Data transfer of 106 kbit/s
- Data integrity of 16-bit CRC, parity, bit coding, bit counting
- Operating distance up to 100 mm (depending on various parameters as e.g. field strength and antenna geometry)
- 7 bytes serial number (cascade level 2 according to ISO/IEC 14443-3)
- Originality signature
- True anticollision

3.1 EEPROM

- 64 bytes organized in 16 pages with 4 bytes per page
- 48 bytes freely available user Read/Write area (12 pages)
- 4 bytes initialized capability container with one time programmable access bits
- Field programmable read-only locking function per page
- Anti-tearing support for capability container (CC) and lock bits
- Pre-programmed ECC-based originality signature, offering the possibility for customizing and permanently locking
- Data retention time of 10 years
- Write endurance 100,000 cycles

4. Applications

- Smart advertisement
- Goods and device authentication
- Call request
- Gaming
- Call to action
- Voucher and coupons
- Bluetooth simple pairing
- Connection handover

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

Quick reference data 5.

LB	LB	Antenna connection LB

9. Functional description

9.1 Block description

NTAG 210 μ ICs consist of a 64 bytes of EEPROM, RF interface and Digital Control Unit (DCU). Energy and data are transferred via an antenna consisting of a coil with a few turns which is directly connected to NTAG 210 μ . No further external components are necessary. Refer to <u>Ref. 4</u> for details on antenna design.

- RF interface:
 - modulator/demodulator
 - rectifier
 - clock regenerator
 - Power-On Reset (POR)
 - voltage regulator
- · Anticollision: multiple cards may be selected and managed in sequence
- Command interpreter: processes memory access commands supported by the NTAG 210μ
- EEPROM interface
- NTAG 210µ EEPROM: 64 bytes, organized in 16 pages of 4 bytes per page.
 - 10 bytes reserved for manufacturer and configuration data
 - 16 bits used for the read-only locking mechanism
 - 4 bytes available as capability container
 - 48 bytes user programmable read/write memory

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

9.2 RF interface

The RF-interface is based on the ISO/IEC 14443 Type A standard.

During operation, the NFC device generates an RF field. The RF field must always be present with short pauses for data communication. It is because it is used for both communication and as power supply for the tag.

For both directions of data communication, there is one start bit at the beginning of each frame. Each byte is transmitted with an odd parity bit at the end. The LSB of the byte with the lowest address of the selected block is transmitted first. The maximum length of an NFC device to tag frame is 163 bits. It comprises 16 data bytes + 2 CRC bytes which equal $16 \times 9 + 2 \times 9 + 1$ start bit. The maximum length of a frame from a tag to an NFC device is 307 bits. It comprises 32 data bytes + 2 CRC bytes which equal $32 \times 9 + 2 \times 9 + 1$ start bit.

For a multi-byte response, the least significant byte is always transmitted first. As an example, when reading from the memory using the READ command, byte 0 from the addressed block is transmitted first. It is then followed by byte 1 to byte 3 from this block. The same sequence continues for the next block and all subsequent blocks.

9.3 Data integrity

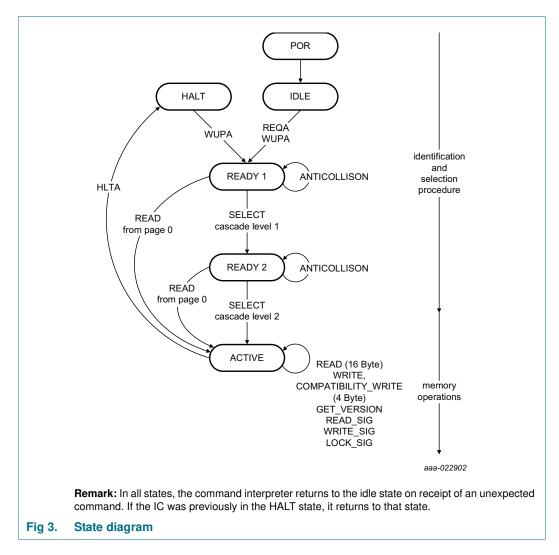

Following mechanisms are implemented in the contactless communication link between NFC device and NTAG to ensure very reliable data transmission:

- 16 bits CRC per block
- parity bits for each byte
- · bit count checking
- bit coding to distinguish between "1", "0" and "no information"
- · channel monitoring (protocol sequence and bit stream analysis)

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

9.4 Communication principle

The NFC device initiates the commands and the Digital Control Unit of the NTAG 210μ , controls them. The command response is depending on the state of the IC and for memory operations also on the access conditions valid for the corresponding page.

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

9.4.1 IDLE state

After a power-on reset (POR), NTAG 210 μ switches to the IDLE state. It only exits this state when a REQA or a WUPA command is received from the NFC device. Any other data received while in this state is interpreted as an error and NTAG 210 μ remains in the IDLE state.

After a correctly executed HLTA command out of the ACTIVE state, the default waiting state changes from the IDLE state to the HALT state. This state can then be exited with a WUPA command or power-on reset only.

9.4.2 READY1 state

In this state, the NFC device resolves the first part of the UID (3 bytes) using the ANTICOLLISION or SELECT commands in cascade level 1. This state is correctly exited after execution of either of the following commands:

- SELECT command from cascade level 1: the NFC device switches NTAG 210µ into READY2 state where the second part of the UID is resolved.
- READ command (from address 0): all anticollision mechanisms are bypassed and the NTAG 210µ switches directly to the ACTIVE state.

Remark: If more than one NTAG 210µ is in the NFC device field, a READ command from address 0 selects all NTAG 210µ devices.

Any other data received in the READY1 state is interpreted as an error and depending on its previous state NTAG 210 μ returns to the IDLE or HALT state.

9.4.3 READY2 state

In this state, NTAG 210 μ supports the NFC device in resolving the second part of its UID (4 bytes) with the cascade level 2 ANTICOLLISION command. This state is usually exited using the cascade level 2 SELECT command.

Alternatively, READY2 state can be skipped using a READ command (from address 0) as described for the READY1 state.

Remark: The response of NTAG 210 μ to the cascade level 2 SELECT command is the select acknowledge (SAK) byte. In accordance with ISO/IEC 14443, this byte indicates if the anticollision cascade procedure has finished. NTAG 210 μ is now uniquely selected and only this device communicates with the NFC device even when other contactless devices are present in the NFC device field. If more than one NTAG 210 μ is in the NFC device field, a READ command from address 0 selects all NTAG 210 μ devices. In this case, a collision occurs.

Any other data received when the device is in this state is interpreted as an error. Depending on its previous state, the NTAG 210μ returns to either the IDLE state or HALT state.

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

9.4.4 ACTIVE state

All memory operations and other functions like the originality check are operated in the ACTIVE state.

The ACTIVE state is exited with the HLTA command and upon reception NTAG 210 μ transits to the HALT state.

Any other data received when the device is in this state is interpreted as an error. Depending on its previous state NTAG 210μ returns to either the IDLE state or HALT state.

9.4.5 HALT state

HALT and IDLE states constitute the two wait states implemented in NTAG 210 μ . An already processed NTAG 210 μ can be set into the HALT state using the HLTA command. In the anticollision phase, this state helps the NFC device to distinguish between processed tags and tags yet to be selected. NTAG 210 μ can only exit this state on execution of the WUPA command. Any other data received when the device is in this state is interpreted as an error and NTAG 210 μ state remains unchanged.

9.5 Memory organization

The EEPROM memory is organized in pages with 4 bytes per page. NTAG 210 μ has 16 pages in total. The memory organization can be seen in Figure 4, the functionality of the different memory sections is described in the following sections.

Page	e Adr		Byte number			
Dec	Hex	0	1	2	3	Description
0	0h		serial	number		
1	1h		serial	number		Manufacturer data and static lock bytes
2	2h	serial number	internal	lock bytes		
3	3h		Capability C	Capability Container		
4	4h					
5	5h					
			User r	nemory		User memory pages
14	Eh					
15	Fh					

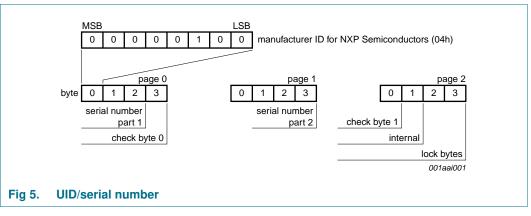

Fig 4. Memory organization NTAG 210µ

The structure of manufacturing data, static lock bytes, capability container and user memory pages are compatible to NTAG 210.

9.5.1 UID/serial number

The unique 7-byte serial number (UID) and its two check bytes are programmed into the first 9 bytes of memory. It covers page addresses 00h, 01h and the first byte of page 02h. The second byte of page address 02h is reserved for internal data. These bytes are programmed and write protected in the production test.

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

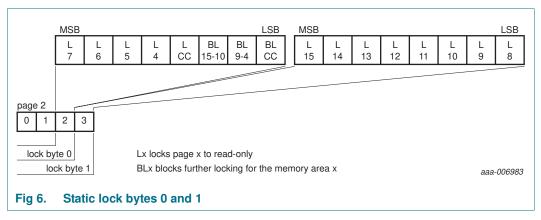

In accordance with ISO/IEC 14443-3, check byte 0 (BCC0) is defined as CT \oplus SN0 \oplus SN1 \oplus SN2. Check byte 1 (BCC1) is defined as SN3 \oplus SN4 \oplus SN5 \oplus SN6.

SN0 holds the Manufacturer ID for NXP Semiconductors (04h) in accordance with ISO/IEC 14443-3.

9.5.2 Static lock bytes

The bits of byte 2 and byte 3 of page 02h represent the field programmable read-only locking mechanism. Each page from 03h (CC) to 0Fh can be individually locked by setting the corresponding locking bit Lx to logic 1. This locking prevents further write access and the corresponding block becomes read-only memory.

The three least significant bits of lock byte 0 are the block-locking bits. Bit 2 deals with blocks 0Ah to 0Fh, bit 1 deals with blocks 04h to 09h and bit 0 deals with block 03h (CC). Once the block-locking bits are set, the locking configuration for the corresponding memory area is frozen.

For example if BL15-10 is set to logic 1, then bits L15 to L10 (lock byte 1, bit[7:2]) can no longer be changed. A WRITE or COMPATIBILITY_WRITE command to block 02h, sets the static locking and block-locking bits. Data bytes 2 and 3 of the WRITE or COMPATIBILITY_WRITE command, and the contents of the lock bytes, are a bit-wise OR. The result becomes the new content of the lock bytes. This process is irreversible. If a bit is set to logic 1, it cannot be changed back to logic 0.

The contents of bytes 0 and 1 of block 02h are unaffected by the corresponding data bytes of the WRITE or COMPATIBILITY_WRITE command.

NT2L1001 NT2H1001

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

The default value of the static lock bytes is 00 00h.

Any write operation to the static lock bytes is tearing-proof.

9.5.3 Capability Container (CC bytes)

The Capability Container CC (block 3) is programmed during the IC production according to the NFC Forum Type 2 Tag specification (see <u>Ref. 2</u>). These bytes may be bit-wise modified by a WRITE or COMPATIBILITY_WRITE command.

	page 3 byte 12 13 14 15	Example NTA		CC bytes		
		11100001	00010000	00000110	00000000	
	CC bytes	write comma	nd to page 3			
		00000000	00000000	00000000	00001111	
		result in page	e 3 (read-only	v state)		
		11100001	00010000	00000110	00001111	
					aaa-006985	
	This memory area can be used as	a 32 tick one	-time counte	er.		
Fig 7.	CC bytes					

The parameter bytes of the WRITE command and the current contents of the CC bytes are bit-wise OR'ed. The result is the new CC byte contents. This process is irreversible and once a bit is set to logic 1, it cannot be changed back to logic 0.

Any write operation to the CC bytes is tearing-proof.

The default values of the CC bytes at delivery are defined in Section 9.5.5.

9.5.4 Data blocks

Blocks 04h to 0Fh for NTAG 210 μ are the user memory read/write area.

The default values of the data blocks at delivery are defined in Section 9.5.5.

9.5.5 Memory content at delivery

The capability container in block 03h, and the data blocks 04h and 05h of NTAG 210 μ , are pre-programmed to the initialized state. It is in accordance with the NFC Forum Type 2 Tag specification (see <u>Ref. 2</u>) as defined in <u>Table 4</u>.

Block Address	Byte number within block								
	0	1	2	3					
03h	E1h	10h	06h	00h					
04h	03h	00h	FEh	00h					
05h	00h	00h	00h	00h					

Table 4. Memory content at delivery NTAG 210µ

Remark: The default content of the data blocks from block 05h onwards is not defined at delivery.

NT2L1001_NT2H1001 Product data sheet COMPANY PUBLIC

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

9.6 Originality signature

The NTAG 210 μ offers a feature to verify the origin of a tag confidently, using the UID toward an originality signature stored in a hidden part of memory. The originality signature can be read with the READ_SIG command.

The NTAG 210μ provides the possibility to customize the originality signature to personalize the IC individually for specific application.

At delivery, the NTAG 210 μ is pre-programmed with the NXP originality signature described below. This signature is locked in the dedicated memory. If needed, the signature can be unlocked with the LOCK_SIG command. It is reprogrammed with a custom-specific signature using the WRITE_SIG command during the personalization process by the customer. The signature can be permanently locked afterwards with the LOCK_SIG command to avoid further modifications.

Remark: If no customized originality signature is required, it is recommended to lock the NXP signature permanently during the initialization process with the LOCK_SIG command.

9.6.1 Originality Signature at delivery

At the delivery, the NTAG 210µ is programmed with an NXP digital signature based on standard Elliptic Curve Cryptography (curve name secp128r1), according to the ECDSA algorithm. The use of a standard algorithm and curve ensures easy software integration of the originality check procedure in NFC devices without specific hardware requirements.

Each NTAG 210μ UID is signed with an NXP private key and the resulting 32-byte signature is stored in a hidden part of the NTAG 210μ memory during IC production.

This signature can be retrieved using the READ_SIG command and verified in the NFC device by using the corresponding ECC public key provided by NXP. In case the NXP public key is stored in the NFC device, the complete signature verification procedure can be performed offline.

To verify the signature, for example with the use of the public domain crypto-library OpenSSL, the tool domain parameters are set to secp128r1. It is defined within the standards for elliptic curve cryptography SEC (Ref. 7).

Details on how to check that the NXP signature value is provided in following application note (Ref. 5). It is foreseen to offer an online and offline way to verify originality of NTAG 210μ .

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

10. Command overview

Table 5.

NTAG 210µ activation follows the ISO/IEC 14443 Type A. After NTAG 210µ has been selected, it can either be deactivated using the ISO/IEC 14443 HLTA command, or the NTAG 210µ commands (e.g. READ or WRITE) can be performed. For more details about the card activation, refer to Ref. 1.

10.1 NTAG 210µ command overview

All available commands for NTAG 210µ are shown in Table 5.

Command ^[1]	ISO/IEC 14443
Command	130/IEC 14443

Command overview

Command ^[1]	ISO/IEC 14443	NFC FORUM	Command code (hexadecimal)
Request	REQA	SENS_REQ	26h (7 bit)
Wake-up	WUPA	ALL_REQ	52h (7 bit)
Anticollision CL1	Anticollision CL1	SDD_REQ CL1	93h 20h
Select CL1	Select CL1	SEL_REQ CL1	93h 70h
Anticollision CL2	Anticollision CL2	SDD_REQ CL2	95h 20h
Select CL2	Select CL2	SEL_REQ CL2	95h 70h
Halt	HLTA	SLP_REQ	50h 00h
GET_VERSION	-	-	60h
READ	-	READ	30h
WRITE	-	WRITE	A2h
COMP_WRITE	-	-	A0h
READ_SIG	-	-	3Ch
WRITE_SIG ^[2]	-	-	A9h
LOCK_SIG ^[2]			ACh

[1] Unless otherwise specified, all commands use the coding and framing as described in Ref. 1.

[2] This command is new in NTAG 210µ compared to NTAG 210.

10.2 Timings

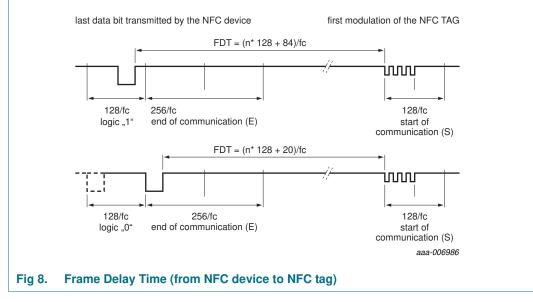

The command and response timings shown in this document are not to scale and values are rounded to 1 µs.

All given command and response transmission times refer to the data frames including start of communication and end of communication. An NFC device data frame contains the start of communication start-bit and the end of communication logic 0 + 1-bit length of unmodulated carrier. An NFC tag data frame contains the start of communication (1 "start bit") and the end of communication (1-bit length of no subcarrier).

The minimum command response time is specified according to Ref. 1 as an integer n which specifies the NFC device to NFC tag frame delay time. The frame delay time from NFC tag to NFC device is at least 87 µs. The maximum command response time is specified as a timeout value. Depending on the command, the TACK value specified for command responses defines the NFC device to NFC tag frame delay time. It does it for either the 4-bit ACK/NAK value specified in Section 10.3 or for a data frame.

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

All command timings are according to ISO/IEC 14443-3 frame specification as shown for the Frame Delay Time in Figure 8. For more details, refer to Ref. 1.

Remark: Due to the coding of commands, the measured timings usually exclude (a part of) the end of communication. Considered this factor when comparing the specified with the measured times.

10.3 NTAG 210µ ACK and NAK

Table 6

NTAG 210µ uses a 4-bit ACK / NAK as shown in Table 6.

ACK and NAK values

Table 6. ACK and NAK values							
Code (4 bit)	ACK/NAK						
Ah	Acknowledge (ACK)						
0h	NAK for invalid argument (i.e. invalid block address)						
1h	NAK for parity or CRC error						
5h or 7h	NAK for EEPROM write error						

10.4 ATQA and SAK responses

NTAG 210µ replies to a REQA or WUPA command with the ATQA value shown in Table 7. It replies to a Select CL2 command with the SAK value shown in Table 8. The 2-byte ATQA value is transmitted with the least significant byte first (44h).

Table 7. ATQA response of the NTAG 210µ

		Bit number															
Sales type	Hex value	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
NTAG 210µ	00 44h	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0

NT2L1001_NT2H1001

All information provided in this document is subject to legal disclaimers.

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

Table 8. SAK response of the NTAG 210µ

		Bit number							
Sales type	Hex value	8	7	6	5	4	3	2	1
NTAG 210µ	00h	0	0	0	0	0	0	0	0

Remark: The ATQA coding in bits 7 and 8 indicate the UID size according to ISO/IEC 14443.

Remark: The bit numbering in the ISO/IEC 14443 starts with LSB = bit 1 and not with LSB = bit 0. So 1 byte counts bit 1 to bit 8 instead of bit 0 to 7.

11. NTAG 210µ commands

11.1 GET_VERSION

The GET_VERSION command is used to retrieve NTAG21x family information, the product version, storage size and other product data required to identify the specific NTAG21x.

This command is also available on all other NTAG21x products to have a common way of identifying products across platforms and evolution steps.

The GET_VERSION command has no arguments and replies the version information for the specific NTAG21x type. The command structure is shown in Figure 9 and Table 9.

Table 10 shows the required timing.

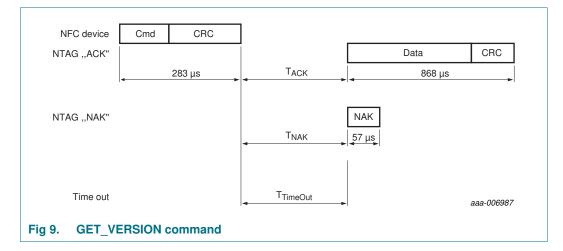

Table 9. GET_VERSION command

Name	Code	Description	Length
Cmd	60h	Get product version	1 byte
CRC	-	CRC according to Ref. 1	2 bytes
Data	-	Product version information	8 bytes
NAK	see <u>Table 6</u>	see Section 10.3	4 bit

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

Table 10. GET_VERSION timing

These times exclude the end of communication of the NFC device.

	T _{ACK/NAK} min	T _{ACK/NAK} max	T _{TimeOut}
GET_VERSION	n = 9 ^[1]	T _{TimeOut}	5 ms

[1] Refer to Section 10.2 "Timings".

Table 11. GET_VERSION response for NTAG 210µ

Byte no.	Description	NT2L1001	NT2H1001	Interpretation
0	fixed Header	00h	00h	
1	vendor ID	04h	04h	NXP Semiconductors
2	product type	04h	04h	NTAG
3	product subtype	01h	02h	17 pF / 50 pF
4	major product version	02h	02h	2
5	minor product version	00h	00h	V0
6	storage size	0Bh	0Bh	see following information
7	protocol type	03h	03h	ISO/IEC 14443-3 compliant

The most significant 7 bits of the storage size byte are interpreted as an unsigned integer value n. As a result, it codes the total available user memory size as 2^n . If the least significant bit is 0b, the user memory size is exactly 2^n . If the least significant bit is 1b, the user memory size is between 2^n and 2^{n+1} .

The user memory for NTAG 210 μ is 48 bytes. This memory size is between 32 bytes and 64 bytes. Therefore, the most significant 7 bits of the value 0Bh, are interpreted as 5d and the least significant bit is 1b.

NT2L1001_NT2H1001

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

11.2 READ

The READ command requires a start block address, and returns the 16 bytes of four NTAG 210 μ blocks. For example, if address (Addr) is 03h then blocks 03h, 04h, 05h, 06h are returned. Special conditions apply if the READ command address is near the end of the accessible memory area. For details on those cases and the command structure, refer to Figure 10 and Table 12.

Table 13 shows the required timing.

NFC device	Cmd	Addr	CRC			
NTAG "ACK"					Data	CRC
	-	368	µs 🕨	TACK	- 15	548 μs
NTAG "NAK"					NAK	
-))				T _{NAK}	57 μs	
Time out				T _{TimeOut}		aaa-006988
Fig 10. REA	AD com	mand				

Table 12.READ command

Name	Code	Description	Length
Cmd	30h	read four blocks	1 byte
Addr	-	start block address	1 byte
CRC	-	CRC according to Ref. 1	2 bytes
Data	-	Data content of the addressed blocks	16 bytes
NAK	see <u>Table 6</u>	see Section 10.3	4 bit

Table 13. READ timing

These times exclude the end of communication of the NFC device.

	T _{ACK/NAK} min	T _{ACK/NAK} max	T _{TimeOut}
READ	n = 9 <u>[1]</u>	T _{TimeOut}	5 ms

[1] Refer to <u>Section 10.2 "Timings"</u>.

Valid memory blocks as Addr parameter to the READ command are

• block address 00h to 0Fh

Addressing a memory block beyond the limits above results in a NAK response from NTAG 210 $\mu.$

A roll-over mechanism is implemented to continue reading from block 00h once the end of the accessible memory is reached. Reading from address 0Dh on a NTAG 210 μ results in blocks 0Dh, 0Eh, 0Fh and 00h being returned.

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

11.3 WRITE

The WRITE command requires a block address, and writes 4 bytes of data into the addressed NTAG 210µ block. The WRITE command is shown in Figure 11 and Table 14.

Table 15 shows the required timing.

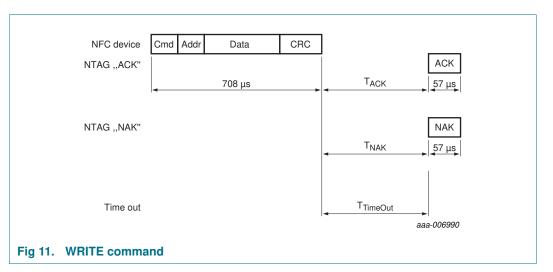

Table 14.WRITE command

Name	Code	Description	Length
Cmd	A2h	write one block	1 byte
Addr	-	block address	1 byte
CRC	-	CRC according to Ref. 1	2 bytes
Data	-	data	4 bytes
NAK	see <u>Table 6</u>	see Section 10.3	4 bit

Table 15. WRITE timing

These times exclude the end of communication of the NFC device.

	T _{ACK/NAK} min	T _{ACK/NAK} max	T _{TimeOut}
WRITE	n = 9[1]	T _{TimeOut}	10 ms

[1] Refer to <u>Section 10.2 "Timings"</u>.

In the initial state of NTAG 210 μ , the following memory blocks are valid Addr parameters to the WRITE command.

block address 02h to 0Fh for NTAG 210μ

Addressing a memory block beyond the limits above results in a NAK response from NTAG 210 μ . Blocks which are locked against writing cannot be reprogrammed using any write command. The locking mechanisms also include the static lock bits.

NTAG 210µ features tearing protected write operations to specific memory content. The following blocks are protected against tearing events during a WRITE operation:

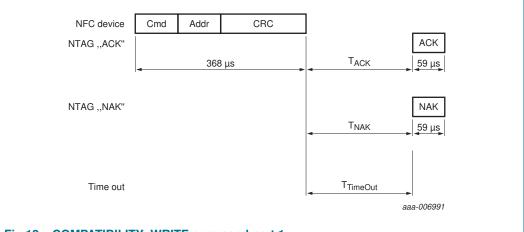

- block 02h containing static lock bits
- block 03h containing CC bits

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

11.4 COMPATIBILITY WRITE

The COMPATIBILITY WRITE command is implemented to guarantee interoperability with the established MIFARE Classic PCD infrastructure, in case of coexistence of ticketing and NFC applications. Even though 16 bytes are transferred to NTAG 210µ, only the least significant 4 bytes (bytes 0 to 3) are written to the specified address. Set all the remaining bytes, 04h to 0Fh, to logic 00h. The COMPATIBILITY_WRITE command is shown in Figure 12, Figure 13 and Table 14.

Table 17 shows the required timing.

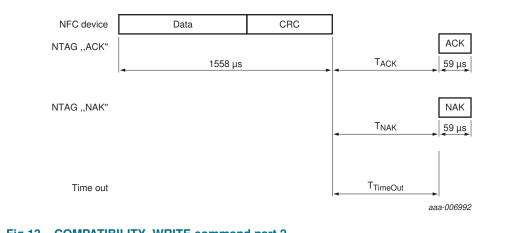

Fig 13. COMPATIBILITY_WRITE command part 2

Table 16. COMPATIBILITY WRITE command

—						
Name	Code	Description	Length			
Cmd	A0h	compatibility write	1 byte			
Addr	-	block address	1 byte			
CRC	-	CRC according to Ref. 1	2 bytes			
Data	-	16-byte Data, only least significant 4 bytes are written	16 bytes			
NAK	see <u>Table 6</u>	see Section 10.3	4 bit			

NT2L1001_NT2H1001

All information provided in this document is subject to legal disclaimers.

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

Table 17. COMPATIBILITY_WRITE timing

These times exclude the end of communication of the NFC device.

	T _{ACK/NAK} min	T _{ACK/NAK} max	T _{TimeOut}
COMPATIBILITY_WRITE part 1	n = 9 ^[1]	T _{TimeOut}	5 ms
COMPATIBILITY_WRITE part 2	n = 9 <u>[1]</u>	T _{TimeOut}	10 ms

[1] Refer to Section 10.2 "Timings".

In the initial state of NTAG 210μ , the following memory blocks are valid Addr parameters to the COMPATIBILITY_WRITE command.

block address 02h to 0Fh for NTAG 210µ

Addressing a memory block beyond the limits above results in a NAK response from NTAG 210 μ .

Blocks which are locked against writing cannot be reprogrammed using any write command. The locking mechanisms include the static bits as well.

NTAG 210 μ features tearing protected write operations to specific memory content. The following blocks are protected against tearing events during a COMPATIBILITY_WRITE operation:

- block 02h containing static lock bits
- block 03h containing CC bits

11.5 READ_SIG

The READ_SIG command returns an IC specific, 32-byte ECC signature. The command structure is shown in Figure 14 and Table 18.

Table 19 shows the required timing.

NFC device	Cmd	Addr	CRC]
NTAG "ACK"				Sign CRC
		368	μs	Т _{АСК} 2907 µs
NTAG "NAK"				NAK
Time out				TTimeOut aaa-006994
Fig 14. READ_SIG com	nmand			

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

Table 18. READ_SIG command

—					
Name	Code	Description	Length		
Cmd	3Ch	read ECC signature	1 byte		
Addr	00h	RFU, is set to 00h	1 byte		
CRC	-	CRC according to Ref. 1	2 bytes		
Signature	-	ECC signature	32 bytes		
NAK	see <u>Table 6</u>	see Section 10.3	4 bit		

Table 19. READ_SIG timing

These times exclude the end of communication of the NFC device.

	T _{ACK/NAK} min	T _{ACK/NAK} max	T _{TimeOut}
READ_SIG	n = 9 <u>[1]</u>	T _{TimeOut}	5 ms

[1] Refer to <u>Section 10.2 "Timings"</u>.

Details on how to check that the signature value is provided in the application note (Ref. 5). It is foreseen to offer an online and offline way to verify originality of NTAG 210 μ .

11.6 WRITE_SIG

The WRITE_SIG command allows the writing of a customized originality signature into the dedicated originality signature memory.

The WRITE_SIG command requires an originality signature block address, and writes 4 bytes of data into the addressed originality signature block. The WRITE_SIG command is shown in Figure 15 and Table 20.

Table 21 shows the required timing.

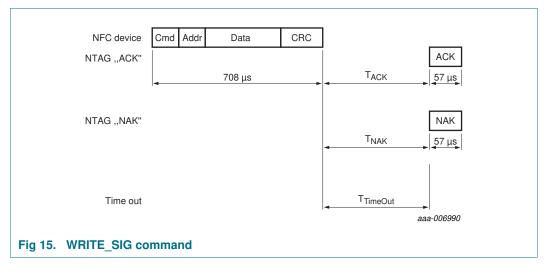

Table 20. WRITE_SIG command

Name	Code	Description	Length
Cmd	A9h	write one originality signature block	1 byte
Addr	-	block address	1 byte

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

Table 20. WRITE_SIG command

Name	Code	Description Length	
CRC	-	CRC according to Ref. 1	2 bytes
Data	-	signature bytes to be written	4 bytes
NAK	see <u>Table 6</u>	see Section 10.3	4 bit

Table 21. WRITE_SIG timing

These times exclude the end of communication of the NFC device.

	T _{ACK/NAK} min	T _{ACK/NAK} max	T _{TimeOut}
WRITE_SIG	n = 9 <u>[1]</u>	T _{TimeOut}	10 ms

[1] Refer to Section 10.2 "Timings".

In the initial state of NTAG 210 μ , the following originality signature blocks are valid Addr parameters to the WRITE_SIG command.

originality signature block address 00h to 07h for NTAG 210µ

Addressing a memory block beyond the limits above results in a NAK response from NTAG 210 μ .

Table 22. Blocks for the WRITE_SIG command

Originality signature block	byte 0	byte 1	byte 2	byte 3
00h				MSByte
01h				
06h				
07h	LSByte			

11.7 LOCK_SIG

The LOCK_SIG command allows the user to unlock, lock or permanently lock the dedicated originality signature memory.

The originality signature memory can only be unlocked if the originality signature memory is not permanently locked.

Permanently locking of the originality signature with the LOCK-SIG command is irreversible and the originality signature memory can never be unlocked and reprogrammed again.

The LOCK_SIG command is shown in Figure 16 and Table 23.

Table 24 shows the required timing.

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

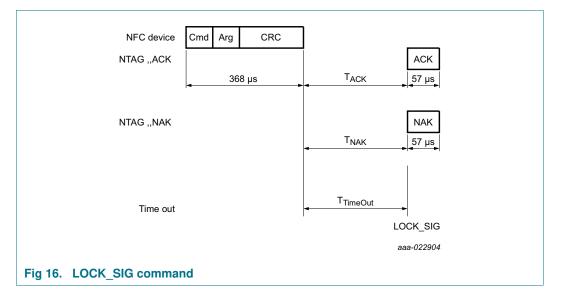

Table 23. LOCK_SIG command

Name	Code	Description	Length
Cmd	A9h	lock signature	1 byte
Arg	-	locking action	1 byte
		00h - unlock	1 byte
		01h - lock	1 byte
		02h - permanently lock	1 byte
CRC	-	CRC according to Ref. 1	2 bytes
NAK	see <u>Table 6</u>	see Section 10.3	4 bit

Table 24. LOCK_SIG timing

These times exclude the end of communication of the NFC device.

	T _{ACK/NAK} min	T _{ACK/NAK} max	T _{TimeOut}
LOCK_SIG	n = 9 <u>[1]</u>	T _{TimeOut}	10 ms

[1] Refer to Section 10.2 "Timings".

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

12. Limiting values

Stresses exceeding one or more of the limiting values can permanently damage the device. Exposure to limiting values for extended periods can affect device reliability.

Table 25. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
l _l	input current		-	40	mA
P _{tot}	total power dissipation		-	120	mW
T _{stg}	storage temperature		-55	125	°C
T _{amb}	ambient temperature		-25	70	°C
V _{ESD}	electrostatic discharge voltage	on pin LA/LB [1]	2	-	kV

[1] ANSI/ESDA/JEDEC JS-001; Human body model: C = 100 pF, R = $1.5 \text{ k}\Omega$

13. Characteristics

19. Legal information

19.1 Data sheet status

Document status[1][2]	Product status ^[3]	Definition	
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.	
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.	
Product [short] data sheet	Production	This document contains the product specification.	

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

19.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

19.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

© NXP Semiconductors N.V. 2016. All rights reserved.

NT2L1001 NT2H1001

NTAG 210µ, NFC Forum Type 2 Tag compliant IC

Bare die — All die are tested on compliance with their related technical specifications as stated in this data sheet up to the point of wafer sawing and are handled in accordance with the NXP Semiconductors storage and transportation conditions. If there are data sheet limits not guaranteed, these will be separately indicated in the data sheet. There are no post-packing tests performed on individual die or wafers.

NXP Semiconductors has no control of third party procedures in the sawing, handling, packing or assembly of the die. Accordingly, NXP Semiconductors assumes no liability for device functionality or performance of the die or systems after third party sawing, handling, packing or assembly of the die. It is the responsibility of the customer to test and qualify their application in which the die is used.

All die sales are conditioned upon and subject to the customer entering into a written die sale agreement with NXP Semiconductors through its legal department.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the

20. Contact information

product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

19.4 Licenses

Purchase of NXP ICs with NFC technology

Purchase of an NXP Semiconductors IC that complies with one of the Near Field Communication (NFC) standards ISO/IEC 18092 and ISO/IEC 21481 does not convey an implied license under any patent right infringed by implementation of any of those standards. Purchase of NXP Semiconductors IC does not include a license to any NXP patent (or other IP right) covering combinations of those products with other products, whether hardware or software.

19.5 Trademarks

Notice: All referenced brands, product names, service names and trademarks are the property of their respective owners.

NTAG — is a trademark of NXP B.V.

MIFARE — is a trademark of NXP B.V.
