International IOR Rectifier

PD - 94794 IRLR3714Z IRLU3714Z HEXFET® Power MOSFET

V <sub>DSS</sub>	R <sub>DS(on)</sub> max	Qg
20V	15m $\Omega$	4.7nC

#### **Applications**

- High Frequency Synchronous Buck Converters for Computer Processor Power
- High Frequency Isolated DC-DC Converters with Synchronous Rectification for Telecom and Industrial Use

#### **Benefits**

- Very Low RDS(on) at 4.5V V<sub>GS</sub>
- Ultra-Low Gate Impedance
- Fully Characterized Avalanche Voltage and Current

**Absolute Maximum Ratings** 

	Parameter	Max.	Units	
V <sub>DS</sub>	Drain-to-Source Voltage	20	V	
V <sub>GS</sub>	Gate-to-Source Voltage	± 20		
I <sub>D</sub> @ T <sub>C</sub> = 25°C	Continuous Drain Current, V <sub>GS</sub> @ 10V	37④		
I <sub>D</sub> @ T <sub>C</sub> = 100°C	Continuous Drain Current, V <sub>GS</sub> @ 10V	26	А	
I <sub>DM</sub>	Pulsed Drain Current ①	144		
P <sub>D</sub> @T <sub>C</sub> = 25°C	Maximum Power Dissipation ®	35	W	
P <sub>D</sub> @T <sub>C</sub> = 100°C	Maximum Power Dissipation <sup>⑤</sup>	18	7	
	Linear Derating Factor	0.23	W/°C	
T <sub>J</sub>	Operating Junction and	-55 to + 175	°C	
T <sub>STG</sub>	Storage Temperature Range			
_	Soldering Temperature, for 10 seconds	300 (1.6mm from case)		

#### **Thermal Resistance**

	Parameter	Тур.	Max.	Units
$R_{\theta JC}$	Junction-to-Case		4.28	
$R_{\theta JA}$	Junction-to-Ambient (PCB Mount) <sup>⑤</sup>		50	°C/W
$R_{\theta JA}$	Junction-to-Ambient		110	

Notes ① through ⑤ are on page 11

#### Power MOSFET Selection for Non-Isolated DC/DC Converters

#### **Control FET**

Special attention has been given to the power losses in the switching elements of the circuit - Q1 and Q2. Power losses in the high side switch Q1, also called the Control FET, are impacted by the  $R_{\rm ds(on)}$  of the MOSFET, but these conduction losses are only about one half of the total losses.

Power losses in the control switch Q1 are given by;

$$P_{loss} = P_{conduction} + P_{switching} + P_{drive} + P_{output}$$

This can be expanded and approximated by;

$$\begin{split} P_{loss} &= \left(I_{rms}^{2} \times R_{ds(on)}\right) \\ &+ \left(I \times \frac{Q_{gd}}{i_{g}} \times V_{in} \times f\right) + \left(I \times \frac{Q_{gs2}}{i_{g}} \times V_{in} \times f\right) \\ &+ \left(Q_{g} \times V_{g} \times f\right) \\ &+ \left(\frac{Q_{oss}}{2} \times V_{in} \times f\right) \end{split}$$

This simplified loss equation includes the terms  ${\rm Q_{gs2}}$  and  ${\rm Q_{oss}}$  which are new to Power MOSFET data sheets.

 $Q_{gs2}$  is a sub element of traditional gate-source charge that is included in all MOSFET data sheets. The importance of splitting this gate-source charge into two sub elements,  $Q_{gs1}$  and  $Q_{gs2}$ , can be seen from Fig 16.

 $Q_{gs2}$  indicates the charge that must be supplied by the gate driver between the time that the threshold voltage has been reached and the time the drain current rises to  $I_{dmax}$  at which time the drain voltage begins to change. Minimizing  $Q_{gs2}$  is a critical factor in reducing switching losses in Q1.

 $\rm Q_{oss}$  is the charge that must be supplied to the output capacitance of the MOSFET during every switching cycle. Figure A shows how  $\rm Q_{oss}$  is formed by the parallel combination of the voltage dependant (nonlinear) capacitance's  $\rm C_{ds}$  and  $\rm C_{dg}$  when multiplied by the power supply input buss voltage.

#### Synchronous FET

The power loss equation for Q2 is approximated by;

$$\begin{split} P_{loss} &= P_{conduction} + P_{drive} + P_{output}^* \\ P_{loss} &= \left(I_{rms}^2 \times R_{ds(on)}\right) \\ &+ \left(Q_g \times V_g \times f\right) \\ &+ \left(\frac{Q_{oss}}{2} \times V_{in} \times f\right) + \left(Q_{rr} \times V_{in} \times f\right) \end{split}$$

\*dissipated primarily in Q1.

For the synchronous MOSFET Q2,  $R_{\rm ds(on)}$  is an important characteristic; however, once again the importance of gate charge must not be overlooked since it impacts three critical areas. Under light load the MOSFET must still be turned on and off by the control IC so the gate drive losses become much more significant. Secondly, the output charge  $Q_{\rm oss}$  and reverse recovery charge  $Q_{\rm rr}$  both generate losses that are transfered to Q1 and increase the dissipation in that device. Thirdly, gate charge will impact the MOSFETs' susceptibility to Cdv/dt turn on.

The drain of Q2 is connected to the switching node of the converter and therefore sees transitions between ground and  $V_{\rm in}.$  As Q1 turns on and off there is a rate of change of drain voltage dV/dt which is capacitively coupled to the gate of Q2 and can induce a voltage spike on the gate that is sufficient to turn the MOSFET on, resulting in shoot-through current . The ratio of  $Q_{\rm gd}/Q_{\rm gs1}$  must be minimized to reduce the potential for Cdv/dt turn on.

### D-Pak (TO-252AA) Tape & Reel Information

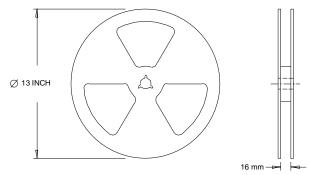

Dimensions are shown in millimeters (inches)

#### NOTES :

- 1. CONTROLLING DIMENSION : MILLIMETER.
- 2. ALL DIMENSIONS ARE SHOWN IN MILLIMETERS (INCHES).
  3. OUTLINE CONFORMS TO EIA-481 & EIA-541.

NOTES

1. OUTLINE CONFORMS TO EIA-481.

#### Notes:

- ① Repetitive rating; pulse width limited by max. junction temperature.
- ② Starting  $T_J = 25$ °C, L = 0.43mH,  $R_G = 25\Omega$ ,  $I_{AS} = 12A$ .
- ③ Pulse width  $\leq$  400 $\mu$ s; duty cycle  $\leq$  2%.
- junction temperature. Package limitation current is 30A.
- ⑤ When mounted on 1" square PCB (FR-4 or G-10 Material). For recommended footprint and soldering techniques refer to application note #AN-994.

Data and specifications subject to change without notice. This product has been designed and qualified for the Industrial market. Qualification Standards can be found on IR's Web site.
