# CD4094BC 8-Bit Shift Register/Latch with 3-STATE Outputs

#### **General Description**

The CD4094BC consists of an 8-bit shift register and a 3-STATE 8-bit latch. Data is shifted serially through the shift register on the positive transition of the clock. The output of the last stage ( $Q_{\rm S}$ ) can be used to cascade several devices. Data on the  $Q_{\rm S}$  output is transferred to a second output,  $Q'_{\rm S}$ , on the following negative clock edge.

The output of each stage of the shift register feeds a latch, which latches data on the negative edge of the STROBE input. When STROBE is HIGH, data propagates through the latch to 3-STATE output gates. These gates are enabled when OUTPUT ENABLE is taken HIGH.

#### Features

■ Wide supply voltage range: 3.0V to 18V

October 1987

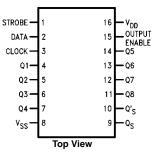

Revised April 2002

- High noise immunity: 0.45 V<sub>DD</sub> (typ.)
- Low power TTL compatibility:
- Fan out of 2 driving 74L or 1 driving 74LS ■ 3-STATE outputs

### **Ordering Code:**

Order Number	Package Number	Package Description		
CD4094BCWM	M16B	16-Lead Small Outline Intergrated Circuit (SOIC), JEDEC MS-013, 0.300" Wide		
CD4094BCN	N16E	16-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300" Wide		
Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.
