

TPS652353 LNB Voltage Regulator with I²C Interface

1 Features

- Complete integrate solution for LNB and I²C interface
- DiSEqC 2.x, and DiSEqC 1.x compatible
- Supports 5-V, 12-V, and 15-V power rail
- Up to 1000-mA accurate output current limit adjustable by external resistor
- Boost switch peak current limit proportional to LDO current limit
- Boost converter with 140-mΩ low R_{ds(on)} internal power switch
- Boost switching frequency 1-MHz or 500-kHz selectable
- Audible noise avoided at Forced PWM mode
- Dedicated enable pin for non-I²C application
- Low-dropout (LDO) regulator with push-pull output stage for VLNB output
- Built-in accurate 22-kHz tone generator and external tone input support
- Supports both external 44-kHz and 22-kHz tone input
- Adjustable soft-start and 13-V to 18-V voltage transition time
- 650-mV to 750-mV 22-kHz tone amplitude selection
- Selectable overcurrent time 29 ms / 58 ms
- I²C registers accessible with EN low
- Short-circuit dynamic protection
- Diagnostics for output voltage level, DiSEqC tone input and output, current level, and cable connection
- Thermal protection available
- 20-pin WQFN 3-mm × 3-mm (RUK) package

2 Applications

- [Set top box satellite receiver](#)
- [TV satellite receiver](#)
- [PC card satellite receiver](#)
- [Satellite TV](#)

3 Description

Designed for analog and digital satellite receivers, the TPS652353 is a monolithic voltage regulator with I²C interface; specifically to provide the 13-V to 18-V power supply and the 22-kHz tone signal to the LNB down converter in the antenna dish or to the multi-switch box. The device offers a complete solution with minimum component count, low power dissipation together with simple design and I²C standard interface.

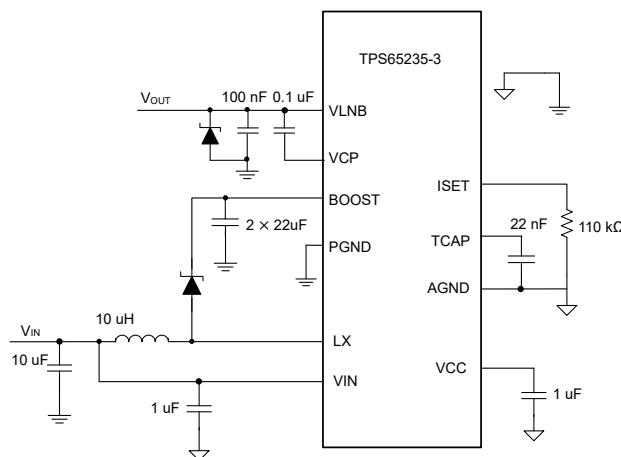

The TPS652353 features high-power efficiency. The boost converter integrates a 140-mΩ power MOSFET running at 1-MHz or 500-kHz selectable switching frequency. Dropout voltage at the linear regulator is 0.8 V to minimize power loss. The TPS652353 provides multiple ways to generate the 22-kHz signal. Integrated linear regulator with push-pull output stage generates 22-kHz tone signal superimposed at the output even at zero loading. Current limit of linear regulator can be programmed by external resistor with ±10% accuracy. Full range of diagnostic read by I²C is available for system monitoring.

The TPS652353 has a special design at forced PWM mode to avoid the audible noise especially when VIN is higher or closer to the VLNB output.

The TPS652353 supports advanced DiSEqC 2.x standard with 22-kHz tone detection circuit and output interface.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (January 2023) to Revision D (May 2023)	Page
• Updated the ADDR pin voltage range for I ² C address 0x11 in Table 7-4	18
<hr/>	
Changes from Revision B (May 2021) to Revision C (January 2023)	Page
• Update the ESD table to be in accordance with standards.....	4
• Changed all instances of legacy terminology to controller and target where I ² C is mentioned.....	18
• Added description of Control Register 2 Bit 6 in Table 7-6	20
<hr/>	
Changes from Revision A (December 2019) to Revision B (May 2021)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• Changed V _(drop) min and max values.....	5
• Changed I _(rev_dis) min and max values.....	5
<hr/>	
Changes from Revision * (December 2019) to Revision A (December 2019)	Page
• Changed marketing status from Advance Information to production data.....	1

5 Pin Configuration and Functions

Figure 5-1. RUK Package. 20-Pin WQFN With Exposed Thermal Pad. Top View.

Table 5-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
1	LX	I	Switching node of the boost converter
2	VIN	S	Input of internal linear regulator
3	VCC	O	Internal 6.3-V power supply. Connect a 1- μ F ceramic capacitor from this pin to ground. When V_{IN} is 5 V, connect the VCC pin to the VIN pin.
4	AGND	S	Analog ground. Connect all ground pins and power pad together.
5	TCAP	O	Connect a capacitor to this pin to set the rise time of the LNB output.
6	ISET	O	Connect a resistor to this pin to set the LNB output current limit.
7	EN	I	Enable this pin to enable the VLNB output. pull this pin to ground to disable the output. The output is then pulled to ground, and, when the EN pin is low, the I ² C interface can be accessed.
8	FAULT	O	Open drain output pin, it goes low if any fault flag is set.
9	ADDR	I	Connect a different resistor to this pin to set different I ² C addresses (see the I²C Address Selection Table 7-4 table).
10	VCTRL	I	Voltage level at this pin to set the output voltage (see the Logic table Table 7-3).
11	SDA	I/O	I ² C compatible bidirectional data
12	SCL	I	I ² C compatible clock input
13	EXTM	I	External modulation logic input pin that activates the 22-kHz tone output. The feeding signal can be 22-kHz tone or logic high or low.
14	DOUT	O	Tone detection output
15	DIN	I	Tone detection input
16	VLNB	O	Output of the power supply connected to satellite receiver or switch
17	VCP	O	Gate drive supply voltage and output of charge pump. Connect a capacitor between this pin and the VLNB pin.
18	BOOST	O	Output of the boost regulator and Input voltage of the internal linear regulator
19	GDR	O	Control the gate of the external MOSFET for DiSEqc 2.x support
20	PGND	S	Power ground for the boost converter
—	Thermal Pad	—	The thermal pad must be soldered to the printed circuit board (PCB) for optimal thermal performance. Use thermal vias on the PCB to enhance power dissipation.

$t_{f(\text{tone})}$	Tone fall time	$0\text{ mA} \leq I_{\text{O}} \leq 500\text{ mA}$, $C_{\text{O}} = 100\text{ nF}$, Control Reg1[0] = 0b		10.8		μs
		$0\text{ mA} \leq I_{\text{O}} \leq 500\text{ mA}$, $C_{\text{O}} = 100\text{ nF}$, Control Reg1[0] = 1b, and EXTM has 44 kHz input		5.4		μs
OVERCURRENT PROTECTION						
t_{ON}	Overcurrent protection ON time	TIMER = 0b	25	29	33	ms
t_{OFF}	Overcurrent protection OFF time	TIMER = 0b	208	233	260	ms
I²C INTERFACE						
t_{BUF}	Bus free time between a STOP and START condition		1.3			μs
$t_{\text{HD_STA}}$	Hold time (repeated) START condition		0.6			μs
$t_{\text{SU_STO}}$	Setup time for STOP condition		0.6			μs
t_{LOW}	LOW period of the SCL clock		1			μs
t_{HIGH}	HIGH period of the SCL clock		0.6			μs
$t_{\text{SU_STA}}$	Setup time for a repeated START condition		0.6			μs
$t_{\text{SU_DAT}}$	Data setup time		0.1			μs
$t_{\text{HD_DAT}}$	Data hold time		0		0.9	μs
t_{RCL}	Rise time of SCL signal	Capacitance of one bus line (pF)	$20 + 0.1 C_B$		300	ns
t_{RCL1}	Rise time of SCL Signal after a Repeated START condition and after an acknowledge BIT	Capacitance of one bus line (pF)	$20 + 0.1 C_B$		300	ns

			MIN	NOM	MAX	UNIT
t _{FCL}	Fall time of SCL signal	Capacitance of one bus line (pF)	20 + 0.1 C _B		300	ns
t _{RDA}	Rise time of SDA signal	Capacitance of one bus line (pF)	20 + 0.1 C _B		300	ns
t _{FDA}	Fall time of SDA signal	Capacitance of one bus line (pF)	20 + 0.1 C _B		300	ns
C _B	Capacitance of one bus line(SCL and SDA)				400	pF

6.7 Typical Characteristics

$T_J = 25^\circ\text{C}$, $V_{IN} = 12\text{ V}$, $f_{SW} = 1\text{ MHz}$, $C_{Boost} = (2 \times 22\ \mu\text{F} / 35\text{ V})$ (unless otherwise noted)

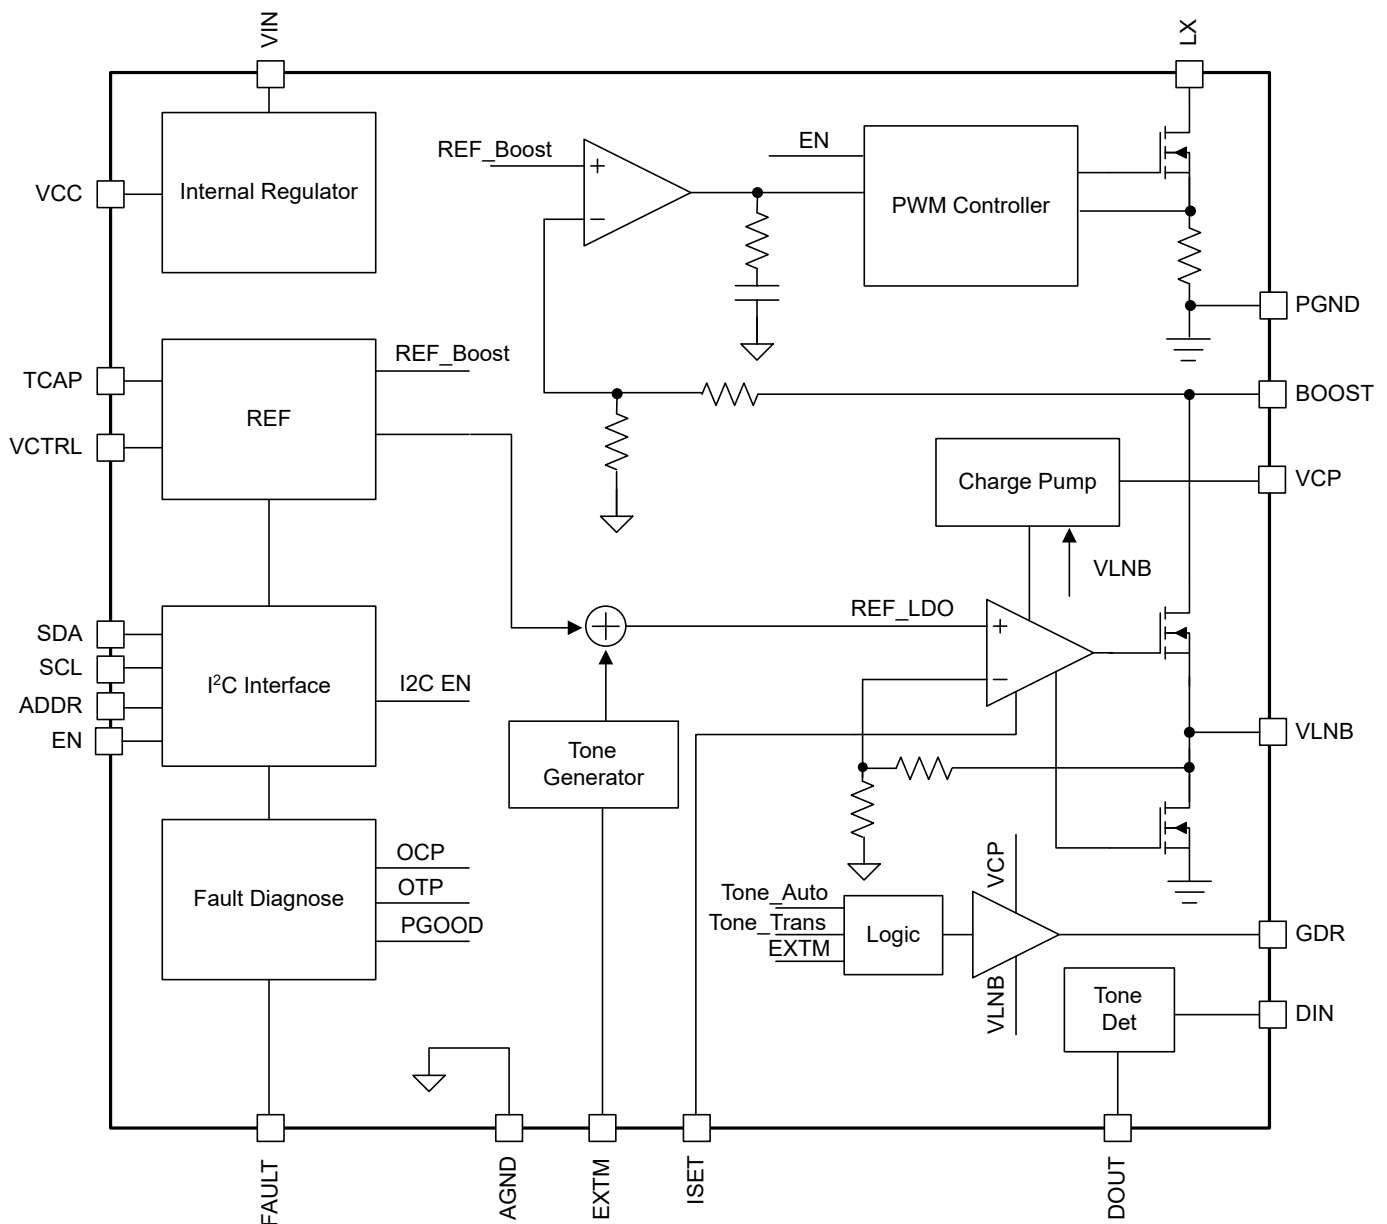

7 Detailed Description

7.1 Overview

The TPS652353 device is the power management IC (PMIC) that integrates a boost converter, an LDO regulator, and a 22-kHz tone generator to serve as a LNB power supply. This solution compiles the DiSEqC 2.x standard with or without I²C interface. An external resistor allows for precise programming of the output current limit. The 22-kHz tone signal can be generated in one of two ways, either with or without I²C. The integrated boost features low R_{ds(on)} MOSFET and internal compensation. A selectable switching frequency of 1 MHz or 500 kHz is designed to reduce the size of passive components and be flexible for design.

The TPS652353 device can support the 44-kHz tone output. When the EXTM pin has a 44-kHz tone input, and the EXTM TONE bit in the [Control Register 1](#) is set to 1b, the LNB tone output is 44 kHz. By default, the TPS652353 device has a typical 22-kHz tone output.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Boost Converter

The TPS652353 device has an internal compensated boost converter and low-dropout (LDO) linear regulator. The boost converter tracks the LNB output voltage within 800 mV even at loading 1000 mA, which minimizes power loss.

The boost converter operates at 1 MHz by default. The TPS652353 device has internal cycle-by-cycle peak current limit in the boost converter and DC current limit in the LNB output to help protect the device from short circuits and over loading. When the LNB output is shorted to ground, the LNB output current is clamped at the LDO current limit. The LDO current limit is set by the external resistor at the ISET pin. The current limit of the boost switch is proportional to the LDO current limit. If an overcurrent condition occurs for more than 29 ms, the boost converter enters hiccup mode and retries startup in 233 ms. This hiccup mode ON time and OFF time are selectable through the I²C control register (address 0x01) to be either 29 ms and 233 ms or 58 ms and 466 ms, respectively. At extremely light loads, the boost converter automatically operates in a pulse-skipping mode.

The boost converter is stable with either ceramic capacitor or electrolytic capacitor.

If two or more set-top box LNB outputs are connected together, one output voltage can be set higher than others. The output with the lower set voltage is then effectively turned off. When the voltage drops to the set level, the LNB output with the lower set output voltage returns to normal conditions.

7.3.2 Linear Regulator and Current Limit

The linear regulator is used to generate the 22-kHz tone signal by changing the LDO reference voltage. The linear regulator features low-dropout voltage to minimize power loss while maintaining enough head room for the 22-kHz tone with 650-mV amplitude. The linear regulator also implements a tight current limit for overcurrent protection. The current limit is set by an external resistor connected to ISET pin. [Linear Regulator Current Limit Vs Resistor](#) shows the relationship between the current limit threshold and the resistor value.

Figure 7-1. Linear Regulator Current Limit Vs Resistor

$$R_{SET} \text{ (k}\Omega\text{)} = 117.08 \times I_{SET}^{-1.267} \text{ (A)} \quad (1)$$

A 200-kΩ resistor sets the current to 0.65 A, and 110-kΩ resistor sets the current to approximately 1 A.

7.3.3 Boost Converter Current Limit

The boost converter has the cycle-by-cycle peak current limit on the internal Power MOSFET switch to serve as the secondary protection when LNB output is hard short. With ISW bit default setting 0b on I²C control register 0x01, the switch current limit I_{SW} is proportional as LDO current limit $I_{(OCP)}$ set by ISET pin resistor, and the relationship can be expressed as:

$$I_{SW} = 3 \times I_{(OCP)} + 0.8 \text{ A} \quad (2)$$

For the 5 V V_{IN} , if LNB current load is up to 1 A, the ISW bit should be written as 1b, the switch current limit I_{SW} for the internal Power MOSFET is:

$$I_{SW} = 5 \times I_{(OCP)} + 0.8 \text{ A} \quad (3)$$

While due to the high power loss at 5 V, V_{IN} , it has a chance to trigger the thermal shutdown before the loading is up to 1 A, especially the VLNB output is high.

7.3.4 Charge Pump

The charge pump circuitry generates a voltage to drive the NMOS of the linear regulator. The voltage across the charge pump capacitor between VLNB and VCP is about 5.4 V, so the absolute value of the VCP voltage will be VLNB + 5.4 V.

7.3.5 Slew Rate Control

When LNB output voltage transits from 13.4 V to 18.2 V or 18.2 V to 13.4 V, the cap at pin TCAP controls the transition time. This transition time makes sure the boost converter output to follow LNB output change. Usually boost converter has low bandwidth and can't response fast. The voltage at TCAP acts as the reference voltage of the linear regulator. The boost converter's reference is also based on TCAP with additional fixed voltage to generate a 0.8 V above the LNB output.

The charging and discharging current is 10 μ A, thus the transition time can be estimated as:

$$t_{TCAP} \text{ (ms)} = 0.8 \times \frac{C_{SS} \text{ (nF)}}{I_{SS} \text{ (\mu A)}} \quad (4)$$

A 22-nF capacitor generates about 2 ms transition time.

In light load conditions, when LNB output voltage is set from 18.2 V to 13.4 V, the voltage drops very slow, which causes wrong $VOUT_GOOD$ (Bit 0 at status register 0x02) logic for LNB output voltage detection. TPS652353 has integrated a pull down circuit to pull down the output during the transition. This ensures the voltage change can follow the voltage at TCAP. When the 22-kHz tone signal is superimposing on the LNB output voltage, the pull down current can also provide square wave instead of a distorted waveforms.

7.3.6 Short Circuit Protection, Hiccup and Overtemperature Protection

The LNB output current limit can be set by an external resistor. When short circuit conditions occur or current limit is triggered, the output current is clamped at the current limit for 29 ms or 58 ms with LDO on. If the condition retains, the converter will shut down for 233 ms or 466 ms and then restart. This hiccup behavior prevents IC from being overheat. The hiccup ON/OFF time can be set by I²C register. Refer to [Control Register 1](#) for detail.

The low side MOSFET of the boost converter has a peak current limit threshold which serves as the secondary protection. If boost converter's peak current limit is triggered, the peak current will be clamped as high as 3.8 A when setting I_{SW} default and LNB current limit up to 1 A. If loading current continues to increase, output voltage starts to drop and output power drops.

Thermal shutdown prevents the chip from operating at exceedingly high temperatures. When the junction temperature exceeds 160°C, the output shuts down. When the die temperature drops below its lower threshold typically 140°C, the output is enabled.

When the chip is in overcurrent protection or thermal shutdown, the I²C interface and logic are still active. The FAULT pin is pulled down to signal the processor. The FAULT pin signal remains low unless the following action is taken:

1. If I²C interface is not used to control, EN pin must be recycled to pull the FAULT pin back to high.
2. If I²C interface is used, the I²C controller need to read the status [Control Register 2](#), then the FAULT pin will be back to high.

7.3.7 Tone Generation

A 22-kHz tone signal is implemented at the LNB output voltage as a carrier for DiSEqC command. This tone signal can be generated by feeding an external 22-kHz clock at the EXTM pin, and it can also be generated with its internal tone generator controlled by EXTM pin. If EXTM pin is toggled to high, the internal tone signal will

be superimposed at the LNB output, if EXTM pin is low, there will be no tone superimposed at the output stage of the regulator facilitates a push-pull circuit, so even at zero loading; the 22-kHz tone at the output is still clean without distortion.

There are two ways to generate the 22-kHz tone signal at the output.

For option1, if the EXTM has 44-kHz tone input, and the bit EXTM TONE of the [Control Register 1](#) is set to 1b, the LNB tone output is 44 kHz.

Option 1. Use external tone, gated by EXTM logic pulse

Option 2. Use internal tone, gated by EXTM logic envelop

Figure 7-2. Two Ways to Generate 22-kHz tone

7.3.8 Tone Detection

A 22-kHz tone detector is implemented in the TPS652353 solution. The detector extracts the AC-coupled tone signal from the DIN input and provides it as an open-drain signal on the DOUT pin. When the DOUTMODE bit in the [Control Register 2](#) is set to the default setting, if a tone is present, the DOUT output is logic low. If a tone is not present, the internal output FET is off. If a pullup resistor is connected to the DOUT pin, the output is logic high. The maximum tone out delay with respect to the input is one and a half of the tone cycle.

The DOUTMODE bit in the [Control Register 2](#) is reserved and should not be used.

7.3.9 Audio Noise Rejection

When the TPS652353 operates in PSM mode, locating the switching frequency at the range of audio frequency is possible. Which causes audible noise, especially when the VLNB voltage is lower or closer to the VIN voltage, and the current load is light.

When audible noise occurs, setting the TPS652353 device to operate in Forced PWM mode is recommended. In Forced PWM mode, a special design is implemented to avoid the audible noise.

7.3.10 Disable and Enable

The TPS652353 device has a dedicated EN pin to disable and enable the LNB output. In a non-I²C application, when the EN pin is pulled high, the LNB output is enabled. When the EN pin is pulled low, the LNB output is disabled. In an I²C application, when the EN pin is either low or high, the I²C registers can be accessed, which allows users to change the default LNB output at system power-up. When the I2C_CON bit in the [Control Register 1](#) is set to 1b, the LNB output enable or disable is controlled by the EN bit in the [Control Register 2](#). By default, the I2C_CON bit of the control register is set to 0b, which makes the LNB output is controlled by the EN pin. [Figure 7-3](#) and [Figure 7-4](#) shows the detailed control behavior.

Note

$V_{(EN)} = 0\text{ V}$

I2C_CON = 1b

Figure 7-3. VLNB Output Controlled by bit EN of Control Register 2

**Note**

I2C_CON = 0b

Figure 7-4. VLNB Output Controlled by EN Pin**7.3.11 Component Selection****7.3.11.1 Boost Inductor**

The TPS652353 device is recommended to operate with a boost inductor value of 4.7 μH or 10 μH. The boost inductor must be able to support the peak current requirement to maintain the maximum LNB output current without saturation. Use Equation 5 to estimate the peak current of the boost inductor (I_{peak}).

$$I_{peak} = \frac{I_{OUT}}{1-D} + \frac{1}{2} \times \frac{V_{IN} \times D}{L \times f_S} \quad (5)$$

where

$$D = 1 - \frac{V_{IN}}{V_{LNB} + 0.8} \quad (6)$$

With a different inductance, the system has different gain and phase margins. Figure 7-5 shows a Bode plot of boost loop with $2 \times 10 \mu\text{F}$ / 35 V of boost capacitor and 4.7 μH, 5.6 μH, 6.8 μH, 8.2 μH, and 10 μH of boost inductance. As the boost inductance increases, the 0-dB crossover frequency keeps relatively constant while reducing the phase and gain margins. With a 4.7-μH boost inductance, the phase margin is 66.96° and with a 10-μH inductance, the phase margin is 39.63°.

Figure 7-5. Gain and Phase Margin of the Boost Loop with Different Inductance
($V_{IN} = 12\text{ V}$, $V_{OUT} = 18.2\text{ V}$, $I_{LOAD} = 1\text{ A}$, $f_{SW} = 1\text{ MHz}$, $5\text{ }\mu\text{F}$, Typical Bode Plot)

7.3.11.2 Capacitor Selection

The TPS652353 device has a 1-MHz nonsynchronous boost converter integrated and the boost converter features the internal compensation network. The TPS652353 device works well with both ceramic capacitor and electrolytic capacitor.

The recommended ceramic capacitors for the TPS652353 application are, at the minimum, rated as X7R/X5R, with a 35-V rating, and a 1206 size for the achieving lower LNB output ripple. Table 7-1 lists the recommended ceramic capacitors list for both 4.7- μH and 10- μH boost inductors.

If more cost-effective design is needed, use a 100- μF electrolytic (low ESR) and a 10- μF or 35-V ceramic capacitor.

Table 7-1. Boost Inductor and Capacitor Selections

BOOST INDUCTOR	CAPACITORS	TOLERANCE (%)	RATING (V)	SIZE
10 μH	2 \times 22 μF	± 10	35	1206
	2 \times 10 μF	± 10	35	1206
4.7 μH	2 \times 22 μF	± 10	35	1206
	2 \times 10 μF	± 10	35	1206
	22 μF	± 10	35	1206

Figure 7-6 and Figure 7-7 show a bode plot of boost loop with 4.7- μH and 10- μH inductance and 4 μF , 5 μF , 7.5 μF , 10 μF , 15 μF , and 20 μF of boost capacitance after degrading. As the boost capacitance increases, the phase margin increases.

7.3.11.3 Surge Components

If a surge test is required for the application, the D0 and D2 diodes should be added as the external protection components. If no surge test is required, remove the D0 and D2 diodes. [Table 7-2](#) lists the recommended surge components.

Table 7-2. Surge Components

DESIGNATOR	DESCRIPTION	PART NUMBER	MANUFACTURER ⁽¹⁾
D0	Diode, TVS, Uni, 28 V, 1500 W, SMC	SMCJ28A	Fairchild Semiconductor
D2	Diode, Schottky, 40 V, 2 A, SMA	B240A-13-F	Diodes Inc.

(1) See [Third-party Products Disclaimer](#)

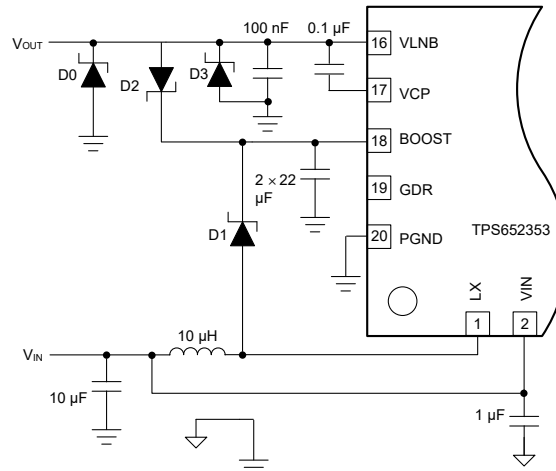

Figure 7-8. Surge Components Selection

7.3.11.4 Consideration for Boost Filtering and LNB Noise

Smaller capacitance on the BOOST pin reduces the cost of the system. However, when the inductor in system is the same, the smaller capacitance on the boost and the larger ripple on the LNB output.

7.4 Device Functional Modes

Table 7-3 is the logic table for the device.

Table 7-3. Logic table

EN	I2C_CON ^{(1) (2) (3)}	SCL	VCTRL	VLNB ⁽⁴⁾
H	0	H	H	19.4 V
H	0	H	L	14.6 V
H	0	L	H	18.2 V
H	0	L	L	13.4 V
X	1	X	X	Controlled by VSET[3:0] bits at 0x01 register ⁽⁵⁾
L	0	X	X	0 V

- (1) I2C_CON is the bit7 of the I²C control register 0x01, which is used to set the VLNB output controlled by the I²C register or not.
- (2) When I²C interface is used in design, all the I²C registers are accessible even if the I2C_CON bit is 0b.
- (3) When I2C_CON is 1b, the VLNB output is controlled by the I²C control register even if the EN pin is low.
- (4) When I²C interface is used in design, it is recommended to set the I2C_CON with 1b, if not, the LNB output will be variable because the SCL is toggled by the I²C register access as the clock signal.
- (5) Bit EN of the control register2 is used to disable or enable the LNB output, by default, the bit EN is 1b which enable the LNB output.

7.5 Programming

7.5.1 Serial Interface Description

I²C is a 2-wire serial interface developed by Philips Semiconductor (see I²C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high external. All the I²C compatible devices connect to the I²C bus through open drain I/O pins, SDA and SCL. A controller device, usually a microcontroller (MCU) or a digital signal processor (DSP), controls the bus. The controller device is responsible for generating the SCL signal and device addresses. The controller device also generates specific conditions that indicate the START and STOP of data transfer. A target device receives, transmits data, or both on the bus under control of the controller device.

The TPS652353 device works as a target and supports the following data transfer modes, as defined in the I²C Bus Specification: standard mode (100 kbps), and fast mode (400 kbps). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the

instantaneous application requirements. Register contents remain intact as long as supply voltage remains above 4.5 V (typical).

The data transfer protocol for standard and fast modes is exactly the same; therefore, they are referred to as F/S-mode in this document. The TPS652353 device supports 7-bit addressing; 10-bit addressing and general call address are not supported.

The TPS652353 device has a 7-bit address set by ADDR pin. Table 7-4 shows how to set the I²C address.

Table 7-4. I²C Address Selection

ADDR PIN	I ² C ADDRESS	ADDRESS FORMAT (A6 ≥ A0)
Connect to VCC	0x08	000 1000b
Floating	0x09	000 1001b
Connected to GND	0x10	001 0000b
Resistor divider to make ADDR pin voltage in 3.7 V - 5.9 V	0x11	001 0001b

Figure 7-9. I²C Interface Timing Diagram

7.5.2 TPS652353 I²C Update Sequence

The TPS652353 requires a start condition, a valid I²C address, a register address byte, and a data byte for a single update. After the receipt of each byte, TPS652353 device acknowledges by pulling the SDA line low during the high period of a single clock pulse. TPS652353 performs an update on the falling edge of the LSB byte.

When the TPS652353 is disabled (EN pin tied to ground) the device cannot be updated via the I²C interface.

The TPS652353 has full range of diagnostic flags for operation and debug. Processor can read the status register to check the error conditions. Once the error happens, the flags are changed, once the errors are gone, the flags are set back without I²C access.

If the TSD and OCP flags are triggered, FAULT pin will be pulled low, so FAULT pin can be the interrupt signal to processor. Once TSD and OCP are set to 1b, the FAULT pin logic is latched to low, processor need to read this status register to release the fault conditions.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The TPS652353 supports both DisEqc1.x and DisEqc2.x application. When the input voltage V_{IN} is greater than the expected output voltage V_{LNB} , the linear regulator drops the voltage difference between V_{IN} and V_{LNB} , which causes the lower efficiency and the higher power loss on the internal linear regulator if the current loading is high. For care must be taken to ensure that the safe operating temperature range of the TPS652353 is not exceeded. TI recommends operating the device in Forced PWM mode when $V_{IN} > V_{OUT}$ to reduce output ripple.

8.2 Typical Application

8.2.1 DiSEqC1.x Support

TPS652353 can operate in I²C and non-I²C interface mode. Figure 8-1 shows the application with the device in I²C interface mode to support DiSEqC 1.x application. In non-I²C mode, the SCL, SDA, and ADDR pins can be floating.

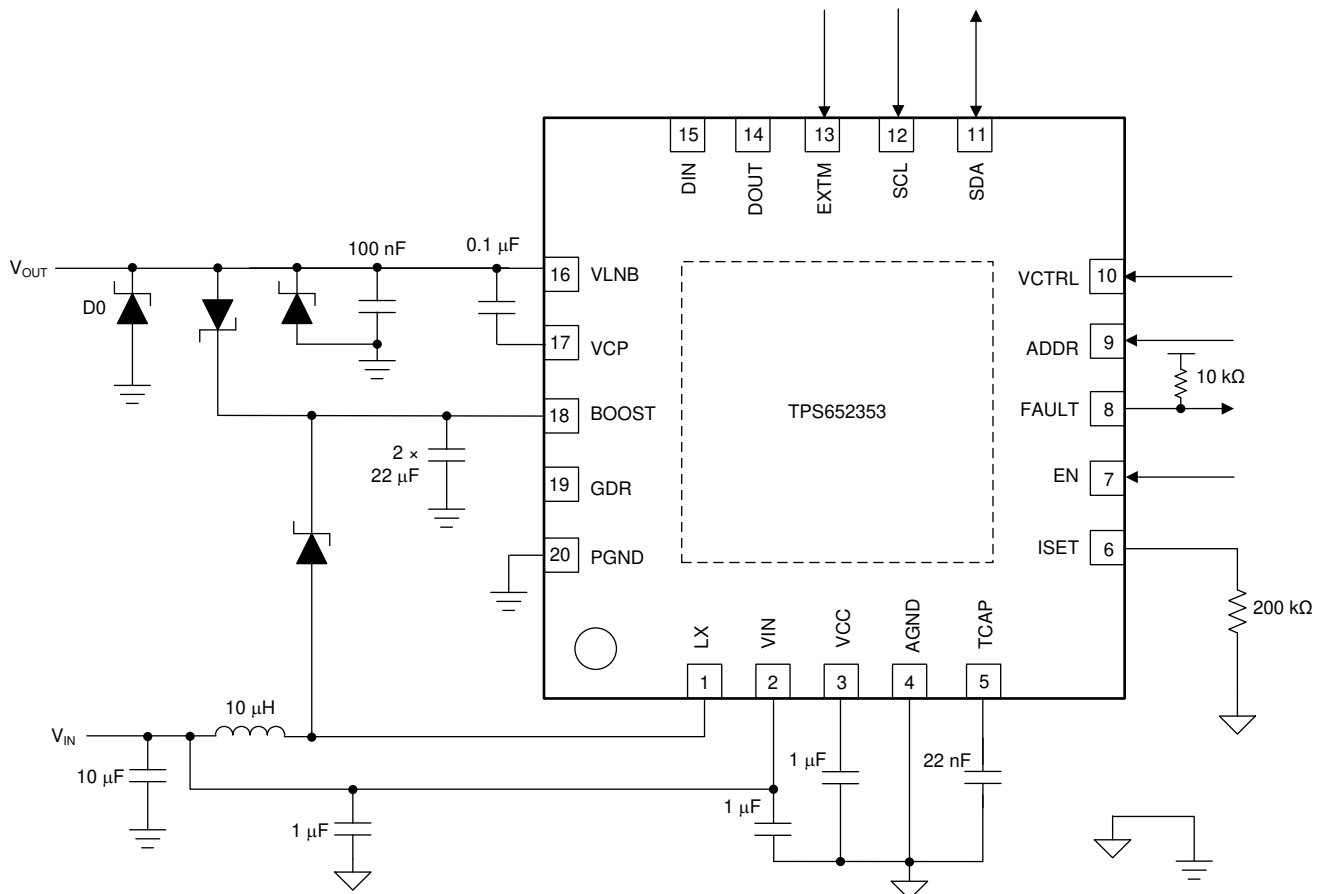

Figure 8-1. Application for DiSEqC1.x Support

8.2.1.1 Design Requirements

For this design example, use the parameters in Table 8-1.

Table 8-1. Design Parameters

PARAMETER	VALUE
Input voltage range, V_{IN}	4.5 V to 20 V
Output voltage range V_{LNB}	11 V to 21 V
Output current range	0 A to 1 A

8.2.1.2 Detailed Design Procedure

To begin the design process, the following component values must be selected:

- Inductor
 - Choose the appropriate value of the inductor based on application cost requirements, ripple requirements, and [Section 7.3.11](#).
- BOOST capacitor
 - Choose the appropriate BOOST capacitor value based on application cost requirements, ripple requirements, and [Section 7.3.11](#).
- Diodes
 - The D0 and D2 diodes are used to help meet the surge-protection requirement of the application. If the application does not require surge protection, remove these diodes. For diode component selection, refer to [Section 7.3.11.3](#).
 - The D1 diode is used for the boost loop. A Schottky diode is recommended for D1. The application requirements, which include input power range, output power range, and the current requirement, determine the current and voltage capability of the D1 diode.
 - The D3 diode is to help with the output protection for the VLNB voltage. A Schottky diode is recommended for D3. The application requirements determine the current and voltage capability of the D3 diode.

8.2.1.3 Application Curves

$T_J = 25^\circ\text{C}$, $V_{IN} = 12\text{ V}$, $f_{SW} = 1\text{ MHz}$, $C_{Boost} = (2 \times 22\ \mu\text{F} / 35\text{ V})$ (unless otherwise noted)

8.2.2 DiSEqC2.x Support

The TPS652353 can support both DiSEqC 1.x application and DiSEqC 2.x application. Figure 8-20 shows the application for supporting DiSEqC 2.x application.

8.2.2.3 Application Curve

Refer to the [DiSEqc1.x Support](#) section for typical application curves. [Figure 8-21](#) is the unique tone-detection curve for the DiSEqc 2.x application.

Figure 8-21. DOUT Tone Detection Output

8.3 Power Supply Recommendations

The device is designed to operate from an input supply ranging from 4.5 V to 20 V. The input supply should be well regulated. If the input supply is located more than a few inches from the converter, an additional bulk capacitance, typically with a value 100 μF , may be required in addition to the ceramic bypass capacitors.

8.4 Layout

8.4.1 Layout Guidelines

The TPS652353 is designed to layout in 2-layer PCB. To ensure reliability of the device, following common printed-circuit board layout guidelines is recommended.

- It is critical to make sure the ground of input capacitor, output capacitor, and the boost converter are connected at one point at same layer.
- The PGND and AGND pins are located in different regions. Connect these grounds to the thermal pad. Other components are connected the AGND pin.
- Put the BOOST capacitors as close as possible.
- The loop from the VIN inductor to the LX pin should be as short as possible.
- The loop from the VIN inductor to D1 Schottky diode to the BOOST should be as short as possible.
- The loop for boost capacitors to the PGND pin should be within the loop from the LX pin to D1 Schottky diode to the BOOST pin.

8.4.2 Layout Example

9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.7 Glossary

TI Glossary

This glossary lists and explains terms, acronyms, and definitions.

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65235-3RUKR	ACTIVE	WQFN	RUK	20	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	652353	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS65235-3RUKR	WQFN	RUK	20	3000	330.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TPS65235-3RUKR	WQFN	RUK	20	3000	367.0	367.0	35.0

RUK0020B

PACKAGE OUTLINE

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
SCALE:20X

SOLDER MASK DETAILS

4222676/A 02/2016

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RUK0020B

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE BASED ON 0.1 mm THICK STENCIL

EXPOSED PAD 21:
78% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
SCALE:20X

4222676/A 02/2016

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
