

GP2AP002S00F

Proximity Sensor

■Description

GP2AP002S00F provide a digital detection system integrated into one package the light emitting element and a light receiving element.

So small package size, it is easy to mount on the equipment.

■Agency approvals/Compliance

1. Compliant with RoHS directive (2002/95/EC)

■Applications

1. Mobile phone
2. Smartphone, Tablet
3. Digital single-lens reflex camera

■Features

1. Disparities in detecting distance results are greatly reduced using a built-in circuit for reduction of light-detecting sensitivity disparities
2. Compact size(4.0 × 2.0 × 1.25t mm)
3. Built-in LED for simple optical design
4. I²C output type

Notice The content of data sheet is subject to change without prior notice.

In the absence of confirmation by device specification sheets, SHARP takes no responsibility for any defects that may occur in equipment using any SHARP devices shown in catalogs, data books, etc. Contact SHARP in order to obtain the latest device specification sheets before using any SHARP device.

Sheet No.: OP13009EN

■ Schematic Internal Block Diagram

■ Outline Dimensions

SCALE	MATERIAL	FINISH	Name	GP2AP002S00F					
10/1	Terminal: Cu Package: Epoxy resin	Terminal: Ni(≥3μm), Au(≥0.1μm)	Outline dimension						
UNIT				DRAWING No. C Y 1 4 4 6 6 i 0 2					
1 = 1/1 mm									

■ Absolute Maximum Ratings

Ta=25°C (unless otherwise specified)

Parameter	Symbol	Rating	Unit	Remarks
Supply voltage	V _{CC}	-0.3 to 3.8	V	
LED supply voltage	V _{LED}	-0.3 to 3.8	V	
LED peak forward current	I _{LED}	300	mA	
Logic I/O supply voltage	V _{IO}	-0.3 to V _{CC} +0.3 and 3.8V or less	V	Cf: Refer to the page 7, Directions for power-line connection
SDA/SCL pull-up voltage	-	V _{IO} -0.3 to V _{IO} +0.3 and 3.8V or less	V	Cf: Refer to the page 7, Directions for power-line connection
Operating temperature	T _{opr}	-25 to +85	°C	
Storage temperature	T _{stg}	-40 to +85	°C	
Soldering temperature	T _{sol}	260	°C	peak temperature duration:10sec

■ Recommended Operating Conditions

Ta=25°C (unless otherwise specified)

Parameter	Symbol	Operating condition	Unit	Remarks
Supply voltage	V _{CC}	2.4 to 3.6	V	
LED supply voltage	V _{LED}	2.4 to 3.6	V	
Operating temperature	T _{opr}	-25 to 85	°C	
Logic I/O supply voltage	V _{IO}	1.65 to V _{CC}	V	
SCL, SDA input low level	V _{IL}	-0.3 to 0.2×V _{IO}	V	
SCL, SDA input high level	V _{IH}	0.8×V _{IO} to V _{IO} +0.3	V	

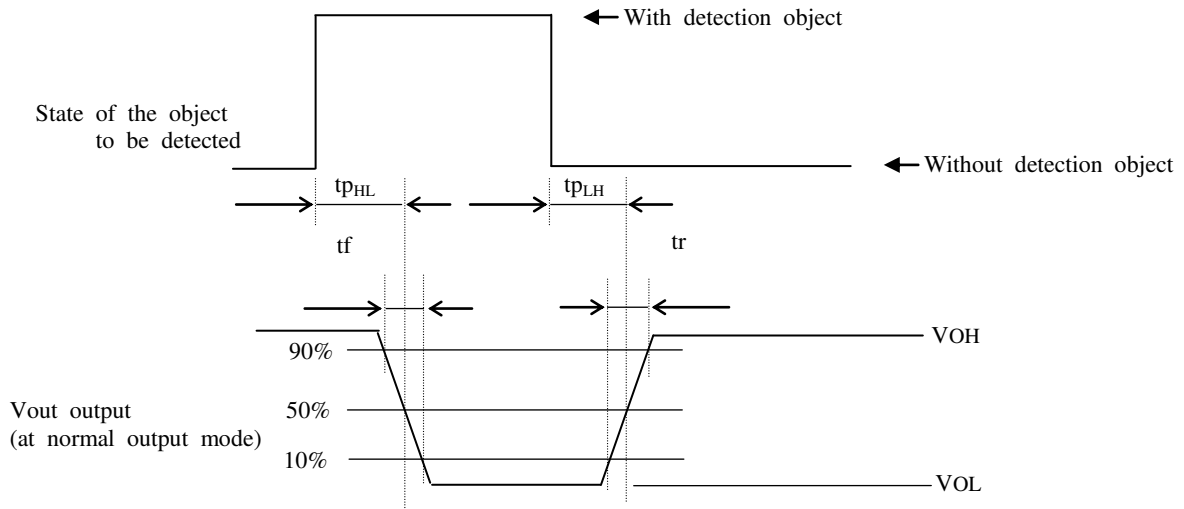

■ Electrical and Optical Characteristics

Ta=25°C, V_{CC}=3.3V, V_{LED}=3.3V R_{LED}=6.8Ω (unless otherwise specified)

Parameter		Symbol	Min.	Typ.	Max.	Unit	Remarks
Current consumption	operating mode	I _{CC}	-	240	600	uA	No detection object, Ev=0 lx. *1, except for LED and driver
	shutdown mode	I _{CC-S}	-	-	1.0		No input signal. *1, except for LED and driver
LED peak current		I _{LED}	-	170	-	mA	
Peak emission wavelength		λ _p	-	940	-	nm	
Vout terminal High level output voltage		V _{OH}	V _{IO} -0.5	V _{IO} -0.3	V _{IO} +0.3	V	I _{OH} =0.3mA, *2
Vout terminal Low level output voltage		V _{OL}	-	-	0.5	V	I _{OL} =1mA, *2
Response time (H→L)		t _{pHL}	-	-	50	ms	*2
Response time (L→H)		t _{pLH}	-	-	50	ms	
Rise time		t _r	-	1	-	μs	*2, CL=15pF
Fall time		t _f	-	1	-	μs	
Maximum detection distance		L _{on}	25	65	-	mm	*3, Detection object: KODAK Gray Card (r = 0.18) Operation mode B1
Minimum no detection distance		L _{off}	-	78	150	mm	
Wake up time		t _{sdw}	-	-	100	ms	*4
Maximum acceptable illuminance		Ev	3000	-	-	lx	*5
SCL clock frequency		SCL	4	-	400	kHz	

*1. Current consumption through VLED terminal (including LED and its driver output) depends on actual environment and situations. (See attached document 【1】 1-1)

*2. Parameters defined for Vout output waveform specifications

*3. Detection distance

GP2AP002S00F output example vs. distance characteristics (operation mode B1)

*4. Wake up time, t_{sdw} , is defined as a delay of the 1st LED emission after issuing the I²C write command to release GP2AP002S00F from the shutdown mode. Note that there should be no external light noise sources in this particular examination. Also, by definition, it does not matter where reflective object is, but it is recommended that the object should be placed at $d \ll L_{on}$ because VO is initialized to 0 and the next expected change is 0 to 1.

*5. Test set-up for “Maximum Acceptable Illuminance” measurement

Illuminance should be measured and evaluated at Emitter/Detector surface of GP2AP002S00F. The maximum acceptable illuminance, E_v , is a maximum level of illuminance at which GP2AP002S00F should keep its sensing result, VO, as "0" (no detection) as long as no reflective objects exist. However, GP2AP002S00F may start to exhibit false detection with external light noise beyond this level. See attached document 【1】 1-10 for more details.

■Supplement

- This product is built-in photodiode.
- Compliance with each regulation
 - 1) The RoHS directive(2002/95/EC)
This product complies with the RoHS directive(2002/95/EC) .
Object substances: mercury, lead, cadmium, hexavalent chromium, polybrominated biphenyls(PBB) and polybrominated diphenyl ethers(PBDE)
 - 2) Content of six substances specified in Management Methods for Control of Pollution Caused by Electronic Information Electronic Information Products Regulation (Chinese : 电子信息产品污染控制管理办法).

Category	Toxic and hazardous substances					
	Lead (Pb)	Mercury (Hg)	Cadmium (Cd)	Hexavalent chromium (Cr ⁶⁺)	Polybrominated biphenyls (PBB)	Polybrominated diphenyl ethers (PBDE)
Proximity sensor	✓	✓	✓	✓	✓	✓

✓ : indicates that the content of the toxic and hazardous substance in all the homogeneous materials of the part is below the concentration limit requirement as described in SJ/T 11363-2006 standard .

- This product shall not contain the following materials.
Also, the following materials shall not be used in the production process for this product.
Materials for ODS : CFCs, Halon, Carbon tetrachloride, 1,1,1-Trichloroethane (Methylchloroform)
- Brominated flame retardants
Specific brominated flame retardants such as the PBB and PBDE are not used in this device at all.
- Product mass : Approx . 0.017 g
- Country of origin : China
- Packing : Refer to the attached sheet, Page 11.
- Moisture level: MSL3

■Notes

- Before the circuit design

In circuit designing, make allowance for the degradation of the light emitting diode output that results from long continuous operation. (50% degradation/5 years)

- Please take proper methods to prevent ESD. The IC built in GP2AP002S00F is ESD-sensitive because it is fabricated by sub-micron CMOS process. For example, in handling GP2AP002S00F, human body and soldering iron etc. should be grounded.

- As it takes at most 100ms to let GP2AP002S00F go to active operation from shut-down mode, please take this delay into system design consideration. Also, if the host system relies on the actual value of this delay, e.g. to do frequent software shutdown, please thoroughly make sure that the operation be successful in any realistic situation.

- Regarding to prevention of malfunction

To prevent GP2AP002S00F from faulty operation due to external light noise sources, do not set the detection surface to these sources directly. Under very unlikely situation, GP2AP002S00F output may fall into malfunction

(See attached document 【1】 1-10 for more detail). It can be reset by letting GP2AP002S00F go shutdown once, and then activating GP2AP002S00F again. In case of this, take it into consideration, in software implementation, to prepare a method to reset GP2AP002S00F. Also, if some other electronic components are placed close to this device, faulty operation may occur. (The light reflection caused by the other components may slip into the photo-detecting portion of the device and may cause faulty operation.)

- Directions for power-line connection

Avoid that GP2AP002S00F's SDA/SCL terminals are pulled-up to the other power line than GP2AP002S00F's Vio terminal even if they are in the same operating voltage. See also 10) Recommended external circuit. For example, when you shut down GP2AP002S00F by letting Vcc and Vio terminals go to GND level (instead of using software shutdown function), and if GP2AP002S00F's SDA/SCL terminals are still pulled-up to another active power line, these terminals will draw significant currents from a pull-up resistor through internal ESD devices and the SCL and SDA lines are pulled-down, which causes system error (I²C bus error).

Also, when you consider reducing total current consumption of the I²C devices by turning off the power line(s), avoid that one of the Vcc and Vio terminals of GP2AP002S00F is turned off and the other is kept on. It never shuts down GP2AP002S00F's current consumption, but possibly yields excessive current between these power lines.

Please consider making use of "software shutdown" function. However, when you do have to turn off one of these power lines (Vcc, Vio, SDA/SCL pull-up level), all of them in GP2AP002S00F should be turned off for the purpose of choking GP2AP002S00F's current consumption regardless of the register setting for the software shutdown function.

- Directions for I²C-bus interface

GP2AP002S00F is equipped with a 7-bit address as a slave device on the I²C bus interface. Through the SDA and SCL terminals, GP2AP002S00F's registers can be set up, and also GP2AP002S00F's sensing result can be read out.

However, the read format specified for GP2AP002S00F is a proprietary one that differs from the normal read format (immediately after the first byte) or the combined format shown in the I²C-bus specification version 2.1, January 2000. For more details to let GP2AP002S00F operate properly, see attached document 【1】 1-2, I²C-bus interface, and 【2】 recommended operation mode / register setting procedure.

- After being mounted and soldered, if GP2AP002S00F is deformed by external force or impact, e.g. something falls onto the device, it may result in defective implementation such as lift-off of the terminals. Careful handling should be taken.

- For soldering

Refer to the page 10

- For cleaning

Cleaning shall carry out as the below items to avoid keeping solvent, solder and flux on the device

- (1) Solvent cleaning : Solvent temperature 45°C or less, Immersion for 3 min or less
- (2) Ultrasonic cleaning : Please don't carry out ultrasonic cleaning.
- (3) The cleaning shall be carried out with solvent below.
Solvent : Ethyl alcohol, Methyl alcohol, Isopropyl alcohol

●Recommended external circuit

(Top View)

Components		Recommended values
CX1		4.7uF (Ceramic)
CX2		0.1uF (Ceramic)
CX3		1.0uF (Ceramic)
CX4		10uF (Ceramic)
R1	1/20W	10 Ω
R _{LED}	1/20W	6.8Ω±1% (V _{CC} =V _{LED} =3.3V)
R _p	1/20W	10k Ω (*)

Notes:

Place the capacitors CX1~CX4 as close as possible to the corresponding terminals. For CX1~CX3, at most 5mm or less is preferable. Depending on the level and/or frequency component(s) of the power supply noise, CX's and R1 listed above may not completely eliminate its influence. Therefore, to avoid GP2AP002S00F's false detection which can be greatly influenced by the supply noises, please carefully make sure that there is no problem with the actual electrical implementation.

Whenever considering to change V_{LED} voltage, choose proper value for R_{LED} so that the desired I_{LED} is obtained. SDA terminal (as output) and LEDA terminal are NMOS open-drain output. On the other hand, Vout terminal is CMOS output, but it has no high-impedance state.

(*) To determine the appropriate value for R_p's, see section 16 of The I²C-Bus Specification.

- Foot pattern of PCB
Dimensions are shown for reference.

1. Dimension in parenthesis are shown for reference.
2. Unit : mm

Pin	Pin name	Symbol
①	LED Anode	LEDA
②	LED Cathode	LEDC
③	Vcc	Vcc
④	Output	Vout
⑤	Ground	GND
⑥	Logic I/O Supply Voltage	Vio
⑦	I ² C DATA BUS	SDA
⑧	I ² C CLOCK	SCL

* Dimension in parenthesis are shown for reference.
Unit : mm

■Precautions for Soldering

1. In case of solder reflow

Reflow is allowed only twice at the temperature and the time within the temperature profile as shown in the figure below.

Reflow interval shall be within 7days under conditions, 10 to 30°C, 70%RH or less.

2. Other precautions

An infrared lamp used to heat up for soldering may cause a localized temperature rise in the resin.

Also avoid immersing the resin part in the soldering.

Even if within the temperature profile above, there is the possibility that the gold wire in package is broken in case that the deformation of PCB gives the affection to lead pins.

Please use after confirmation the conditions fully actual solder reflow machine.

■ Packing

■ Important Notices

· The circuit application examples in this publication are provided to explain representative applications of SHARP devices and are not intended to guarantee any circuit design or license any intellectual property rights. SHARP takes no responsibility for any problems related to any intellectual property right of a third party resulting from the use of SHARP's devices.

· Contact SHARP in order to obtain the latest device specification sheets before using any SHARP device. SHARP reserves the right to make changes in the specifications, characteristics, data, materials, structure, and other contents described herein at any time without notice in order to improve design or reliability. Manufacturing locations are also subject to change without notice.

· Observe the following points when using any devices in this publication. SHARP takes no responsibility for damage caused by improper use of the devices which does not meet the conditions and absolute maximum ratings to be used specified in the relevant specification sheet nor meet the following conditions:

(i) The devices in this publication are designed for use in general electronic equipment designs such as:

- Personal computers
- Office automation equipment
- Telecommunication equipment [terminal]
- Test and measurement equipment
- Industrial control
- Audio visual equipment
- Consumer electronics

(ii) Measures such as fail-safe function and redundant design should be taken to ensure reliability and safety when SHARP devices are used for or in connection

with equipment that requires higher reliability such as:

- Transportation control and safety equipment (i.e., aircraft, trains, automobiles, etc.)
- Traffic signals
- Gas leakage sensor breakers
- Alarm equipment
- Various safety devices, etc.

(iii) SHARP devices shall not be used for or in connection with equipment that requires an extremely high level of reliability and safety such as:

- Space applications
- Telecommunication equipment [trunk lines]
- Nuclear power control equipment
- Medical and other life support equipment (e.g., scuba).

· If the SHARP devices listed in this publication fall within the scope of strategic products described in the Foreign Exchange and Foreign Trade Law of Japan, it is necessary to obtain approval to export such SHARP devices.

· This publication is the proprietary product of SHARP and is copyrighted, with all rights reserved. Under the copyright laws, no part of this publication may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose, in whole or in part, without the express written permission of SHARP. Express written permission is also required before any use of this publication may be made by a third party.

· Contact and consult with a SHARP representative if there are any questions about the contents of this publication.
