### General Description

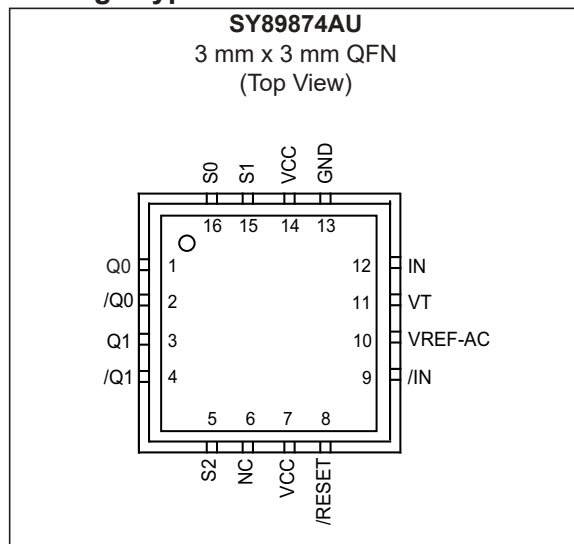

This low-skew, low-jitter device can accept a high-speed (622 MHz or higher) LVTTTL, LVCMOS, CML, LVPECL, LVDS, or HSTL clock input signal and divide down the frequency using a programmable divider ratio to create a frequency-locked, lower speed version of the input clock. Available divider ratios are 2, 4, 8, and 16, or straight pass-through. In a typical 622 MHz clock system this would provide availability of 311 MHz, 155 MHz, 77 MHz, or 38 MHz auxiliary clock components.

The differential input buffer has a unique internal termination design that allows access to the termination network through a VT pin. This feature allows the device to easily interface to different logic standards. A  $V_{REF-AC}$  reference is included for AC-coupled applications.

The /RESET input asynchronously resets the divider. In the pass-through function (divide by 1) the /RESET synchronously enables or disables the outputs on the next falling edge of IN (rising edge of /IN).

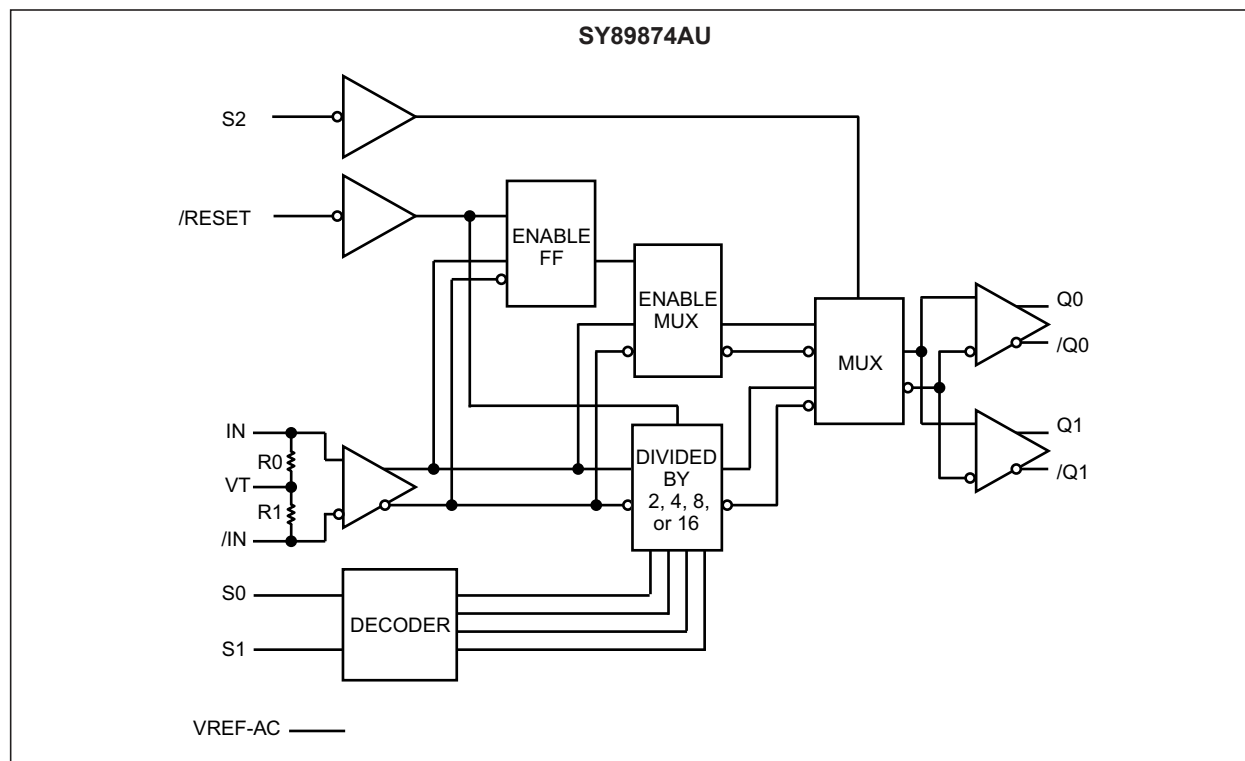

Use the SY89874U version, which has a wider input range, to DC-couple low offset differential signals.

- Due to the internal termination (see the Input Buffer Structure), the input current depends on the applied voltages at the IN, /IN, and VT inputs. Do not apply a combination of voltages that cause the input current to exceed the maximum limit.
- See the Timing Diagram or Definition of Single-Ended and Differential Swing sections for  $V_{IN}$  definition.  $V_{IN}$  (maximum) is specified when VT is floating.
- See the Definition of Single-Ended and Differential Swing section for  $V_{DIFF}$  definition.
- Operation using  $V_{REF-AC}$  is limited to AC-coupled PECL or CML applications only. Connect directly to the VT pin.

Storage Temperature	$T_A$	-65	—	+150	°C	—
Maximum Junction Temperature	$T_J$	—	—	+125	°C	—
<b>Package Thermal Resistance</b>						
Thermal Resistance, QFN 16-Ld	$\theta_{JA}$	—	60	—	°C/W	Still-Air
	$\theta_{JA}$	—	54	—	°C/W	500 lfpm
	$\Psi_{JB}$	—	32	—	°C/W	Junction-to-board, <a href="#">Note 2</a>

**Note 1:** The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e.,  $T_A$ ,  $T_J$ ,  $\theta_{JA}$ ). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. - Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products.
