SBAS099A – MARCH 2001

Sound^{PLUS}™ Stereo, 24-Bit, 96kHz 8X Oversampling Digital Interpolation Filter

FEATURES

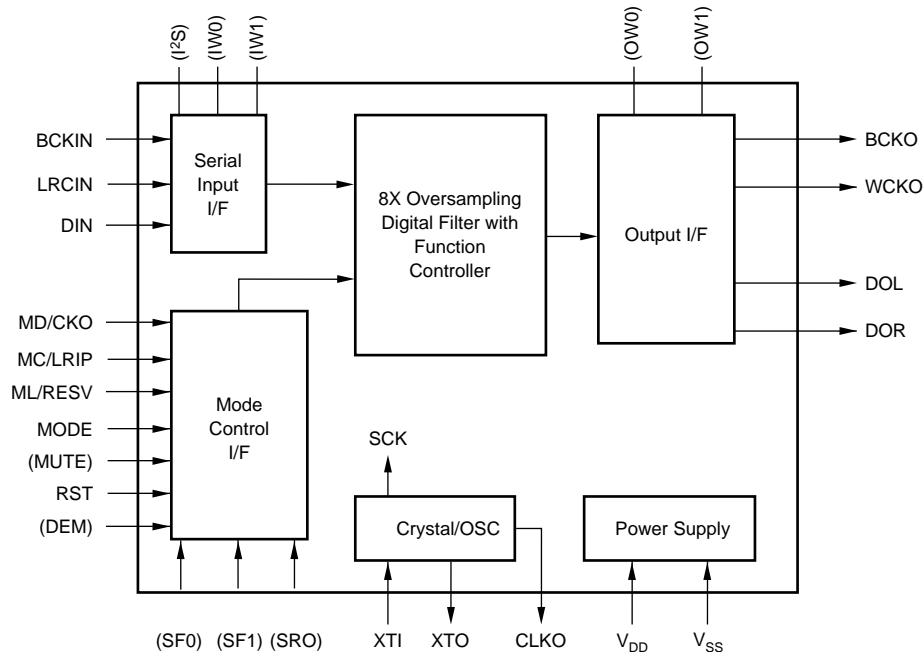

- COMPANION DIGITAL FILTER FOR THE PCM1704 24-BIT AUDIO DAC
- HIGH PERFORMANCE FILTER:
Stopband Attenuation: -115dB
Passband Ripple: ±0.00005dB
- AUDIO INTERFACE:
Input Data Formats: Standard, Left-Justified, and I²S
Input Word Length: 16, 20, or 24 Bits
Output Word Length: 16, 18, 20, or 24 Bits
Sampling Frequency: 32kHz to 96kHz
- PROGRAMMABLE FUNCTIONS:
Hardware or Software Control Modes
Sharp or Slow Roll-Off Filter Response
Soft Mute
Digital De-Emphasis
Independent Left/Right Digital Attenuation

- SYSTEM CLOCK: 256f_s, 384f_s, 512f_s, 768f_s
- ON-CHIP CRYSTAL OSCILLATOR
- +5V SINGLE-SUPPLY OPERATION
- SMALL SSOP-28 PACKAGE

DESCRIPTION

The DF1704 is a high-performance, stereo, 8X oversampling digital interpolation filter designed for high-end consumer and professional audio applications. The DF1704 supports 24-bit, 96kHz operation and features user-programmable functions, including selectable filter response, de-emphasis, attenuation, and input/output data formats.

The DF1704 is the ideal companion for Texas Instruments' PCM1704 24-bit audio digital-to-analog converter. This combination allows for construction of very high-performance audio systems and components.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PACKAGE/ORDERING INFORMATION

PRODUCT	PACKAGE	PACKAGE DRAWING NUMBER	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER	TRANSPORT MEDIA
DF1704E	SSOP-28	324	-25°C to +85°C	DF1704E	DF1704E	Rails

ABSOLUTE MAXIMUM RATINGS

Supply Voltage (V_{DD} , V_{CC1} , V_{CC2R} , V_{CC2L})	+6.5V
Supply Voltage Differences	±0.1
GND Voltage Differences	±0.1V
Digital Input Voltage	-0.3V to (V_{DD} + 0.3V)
Input Current (any pins except power supplies)	±10mA
Power Dissipation	300mW
Operating Temperature Range	-25°C to +85°C
Storage Temperature	-55°C to +125°C
Lead Temperature (soldering, 5s)	+260°C
Package Temperature (reflow, 10s)	+235°C

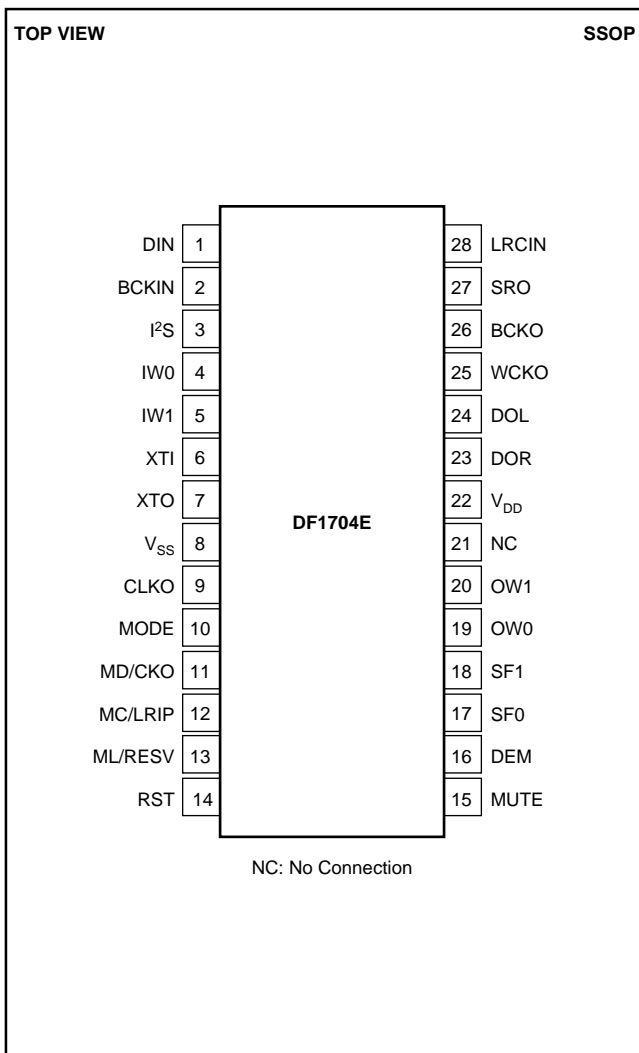

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PIN CONFIGURATION

PIN ASSIGNMENTS

PIN	NAME	I/O	DESCRIPTION
1	DIN	IN	Serial Audio Data Input ⁽³⁾

TYPICAL CHARACTERISTICS OF INTERNAL FILTER

DIGITAL FILTER (DE-EMPHASIS OFF, $f_s = 44.1\text{kHz}$)

DE-EMPHASIS AND DE-EMPHASIS ERROR

TYPICAL CHARACTERISTICS OF INTERNAL FILTER (Cont.)

SYSTEM CLOCK REQUIREMENTS

The system clock of the DF1704 can be supplied by either an external clock signal at XTI (pin 6), or by the on-chip crystal oscillator. The system clock rate must run at $256f_s$, $384f_s$, $512f_s$, or $768f_s$, where f_s is the audio sampling rate.

It should be noted that a $768f_s$ system clock cannot be used when $f_s = 96\text{kHz}$. In addition, the on-chip crystal oscillator is limited to a maximum frequency of 24.576MHz. Table I shows the typical system clock frequencies for selected sample rates.

The DF1704 includes a system clock detection circuit that determines the system clock rate in use. The circuit compares the system clock input (XTI) frequency with the LRCIN input rate to determine the system clock multiplier. Ideally, LRCIN and BCKIN should be derived from the system clock to ensure proper synchronization. If the phase difference between the system clock and LRCIN is larger than ± 6 bit clock (BCKIN) periods, the synchronization of the system and LRCIN clocks will be performed automatically by the DF1704.

Timing requirements for the system clock input are shown in Figure 1.

FIGURE 1. System Clock Timing.

RESET

The DF1704 has both an internal power-on reset circuit and a reset pin, \overline{RST} (pin 14), for providing an external reset signal. The internal power-on reset is performed automatically when power is applied to the DF1704, as shown in Figure 2. The \overline{RST} pin can be used to synchronize the DF1704 with a system reset signal, as shown in Figure 3.

During the power-on reset period (1024 system clocks), the DF1704 outputs are forced LOW. For an external forced reset, the outputs are forced LOW during the initialization period (1024 system clocks), which occurs after the LOW-to-HIGH transition of the \overline{RST} pin as shown in Figure 3.

FIGURE 2. Internal Power-On Reset Timing.

FIGURE 3. External Forces Reset Timing.

AUDIO INPUT INTERFACE

The audio input interface is comprised of BCKIN (pin 2), LRCIN (pin 28), and DIN (pin 1).

BCKIN is the input bit clock, which is used to clock data applied at DIN into the DF1704's input serial interface. Input data at DIN is clocked into the DF1704 on the rising edge of BCKIN. The left/right clock, LRCIN, is used as a word latch for the audio input data.

BCKIN can run at $32f_s$, $48f_s$, or $64f_s$, where f_s is the audio sample frequency. LRCIN is run at the f_s rate. Figures 4 (a) through 4 (c) show the input data formats, which are selected by hardware or software controls. Figure 5 shows the audio input interface timing requirements.

SAMPLING RATE FREQUENCY (f_s)	SYSTEM CLOCK FREQUENCY (MHz)			
	256 f_s	384 f_s	512 f_s	768 f_s
32kHz	8.1920	12.2880	16.3840	24.5760
44.1kHz	11.2896	16.9340	22.5792	33.8688 ⁽¹⁾
48kHz	12.2880	18.4320	24.5760	36.8640 ⁽¹⁾
96kHz	24.5760 ⁽³⁾	36.8640 ⁽¹⁾	49.1520 ⁽¹⁾	See Notes 1, 2

NOTES: (1) Maximum crystal oscillator frequency is 24.576MHz and cannot be used for these combinations. (2) 768 f_s system clock cannot be used with 96kHz sampling rate. (3) Use external system clock applied at XTI.

TABLE I. Typical System Clock Frequencies.

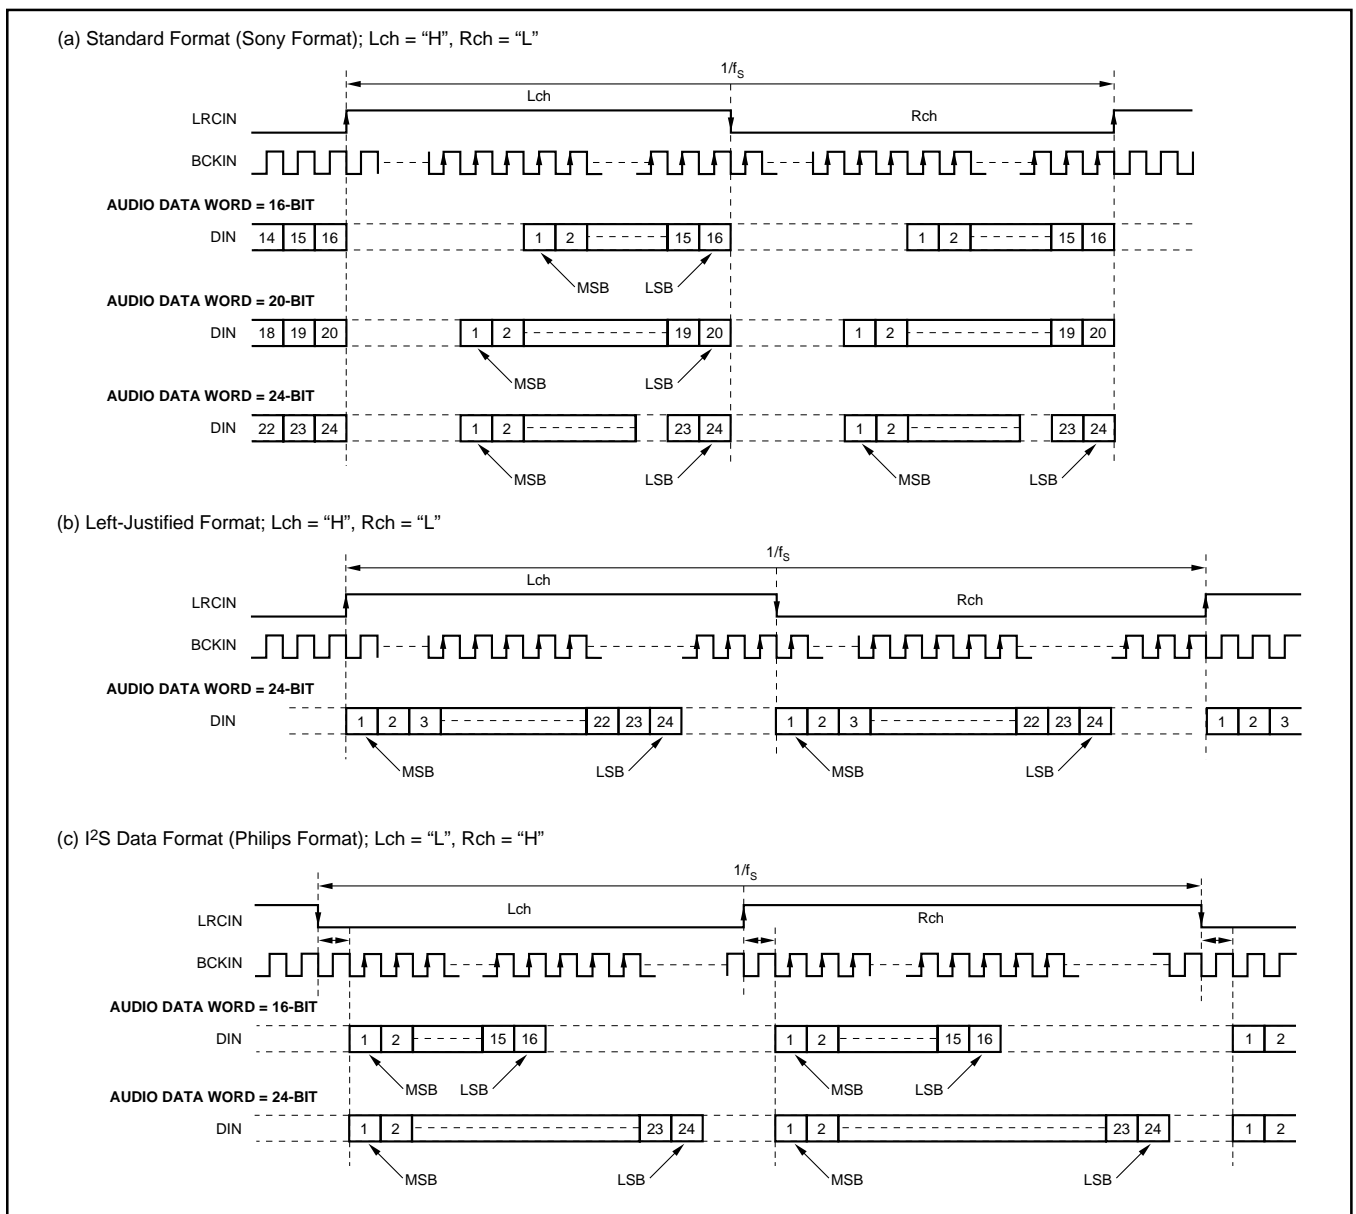

FIGURE 4. Audio Data Input Formats.

FIGURE 5. Audio Input Interface Timing.

AUDIO OUTPUT INTERFACE

The audio output interface includes BCKO (pin 26), WCKO (pin 25), DOL (pin 24), and DOR (pin 23).

BCKO is the output bit clock and is used to clock data into an audio Digital-to-Analog Converter (DAC), such as the PCM1704. DOL and DOR are the left and right audio data outputs. WCKO is the output word clock and is used to latch audio data words into an audio DAC.

WCKO runs at a fixed rate of $8f_s$ (8X oversampling) for all system clock rates.

BCKO is fixed at $256f_s$ for system clock rates of $256f_s$ or $512f_s$.

BCKO is fixed at $192f_s$ for system clock rates of $384f_s$ or $768f_s$.

The output data format used by the DF1704 for DOL and DOR is Binary Two's Complement, MSB-first, right-justified audio data. Figures 6(a) and 6(b) show the output data formats for the DF1704. Figure 7 shows the audio output timing.

MODE CONTROL

The DF1704 may be configured using either software or hardware control. The selection is made using the MODE input (pin 10).

MODE SETTING	MODE CONTROL SELECTION
MODE = H	Software Mode
MODE = L	Hardware Mode

TABLE II. MODE Selection.

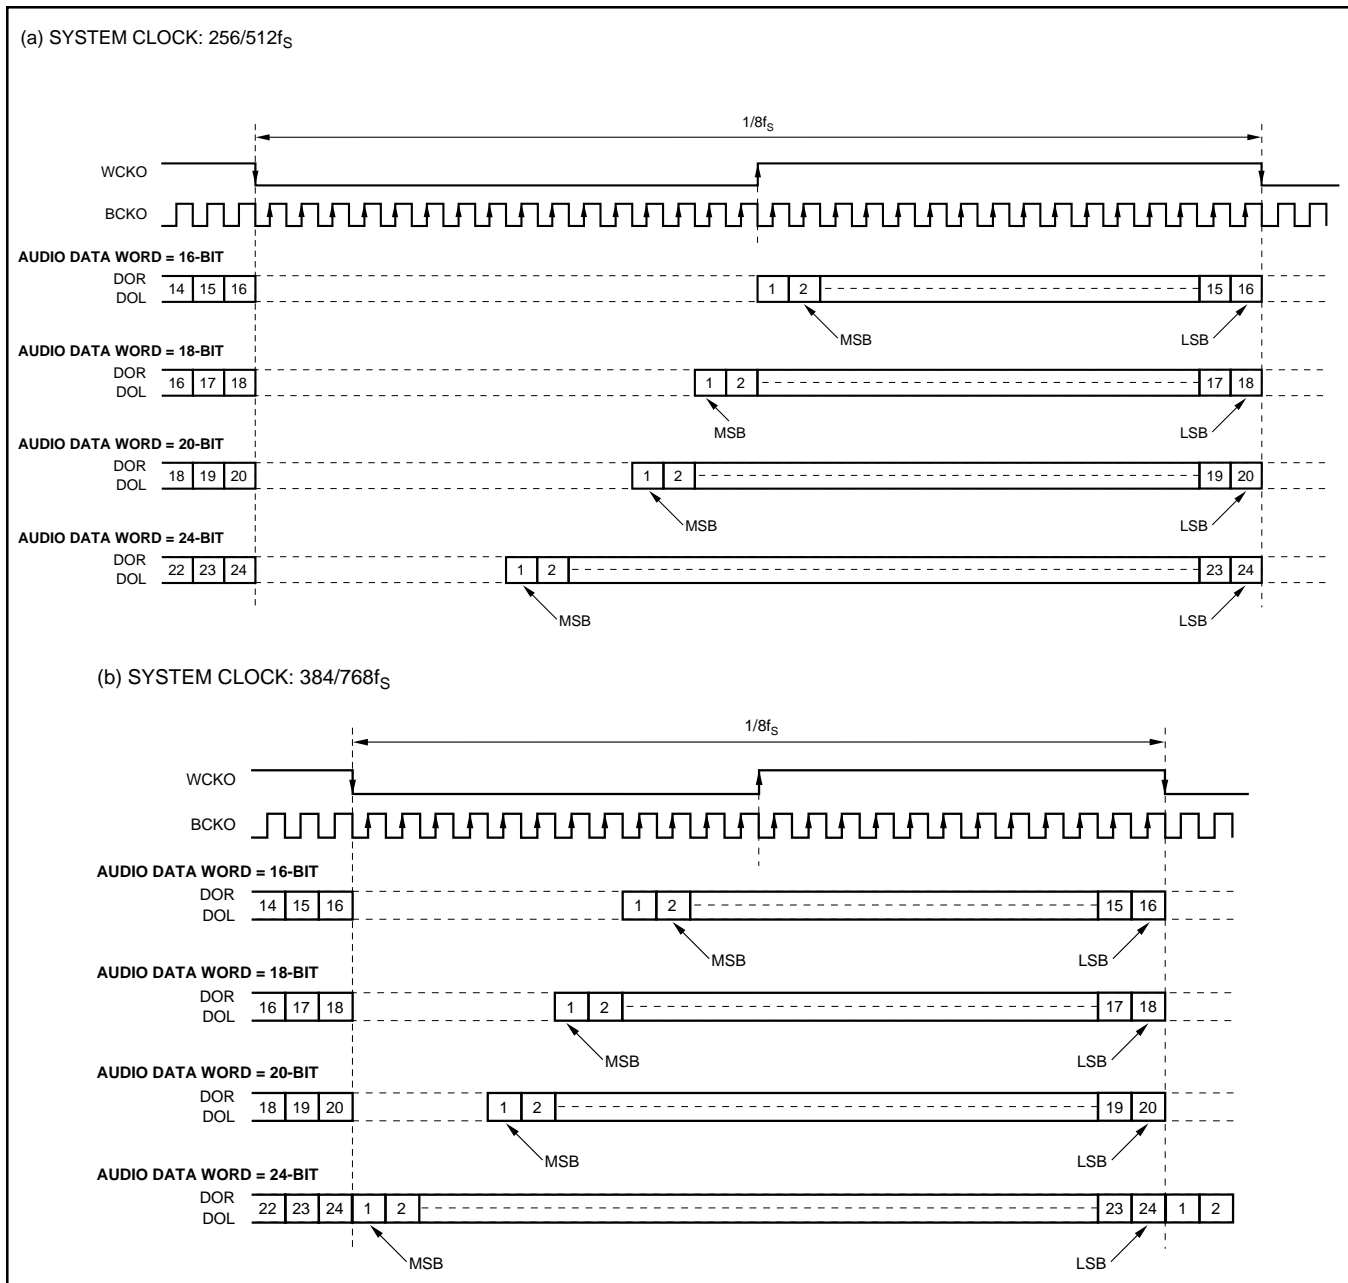

FIGURE 6. Audio Output Data Format.

		min	typ	max
BCKO Period	t_{BCKP}	$1/256 f_s$ or $1/192 f_s$		
BCKO Pulse Width High ⁽⁴⁾	t_{BCKH}	20ns		100ns
BCKO Pulse Width Low ⁽⁴⁾	t_{BCKL}	20ns		100ns

WCKO Period	t_{WCKP}		$1/8 f_s$	
Delay Time BCKO Falling Edge to DOL, R Valid	t_{CKDO}	-5ns		5ns
Rising Time of All Signals	t_R			7ns
Falling Time of All Signals	t_F			7ns

NOTES: (1) Timing measurement reference level is $(V_{IH}/V_{IL})/2$. (2) Rising and falling time is measured from 10% to 90% of IN/OUT signals' swing. (3) Load capacitance of all signals are 20pF. (4) Exceptions: $f_s = 96\text{kHz}$ and $SCK = 256f_s$, $t_{BCKH} = 14\text{ns}$ (min)
 $t_{BCKL} = 14\text{ns}$ (min)

FIGURE 7. Audio Output Data Format.

Programmable Functions

The DF1704 includes a number of programmable features, with most being accessible from either Hardware or Software mode. Table III summarizes the user programmable functions for both modes of operation.

FUNCTION	SOFTWARE (MODE = H)	HARDWARE (MODE = L)	RESET DEFAULT (Software Mode)
Input Data Format Selection	0	0	Standard Format
Input Word Length Selection	0	0	16 Bits
Output Word Length Selection	0	0	16 Bits
LRCIN Polarity Selection	0	0	Left/Right = High/Low
Digital De-Emphasis	0	0	OFF
Soft Mute	0	0	OFF
Digital Attenuation	0	X	0dB, Independent L/R
Sample Rate for De-Emphasis Function	0	0	44.1 kHz
Filter Roll-Off Selection	0	0	Sharp Roll-Off Selected
CLKO Output Frequency Selection	0	0	Same As XTI Input

Legend: 0 = User Programmable, X = Not Available.

TABLE III. User-Programmable Functions for Software and Hardware Mode.

Hardware Mode Controls

With MODE = L, the DF1704 may be configured by utilizing several user-programmable pins. The following is a brief summary of the pin functions. Table IV provides more details on setting the hardware mode controls.

Pins I²S, IW0, and IW1 are used to select the audio data input format and word length.

Pins OW0 and OW1 are used to select the output data word length.

The DEM pin is used to enable and disable the digital de-emphasis function. De-emphasis is only available for 32kHz, 44.1kHz, and 48kHz sample rates.

Pins SF0 and SF1 are used to select the sample rate for the de-emphasis function.

The SRO pin is used to select the digital filter response, either sharp or slow roll-off.

The MUTE pin is used to enable or disable the soft mute function.

The CKO pin is used to select the clock frequency seen at the CLKO pin, either XTI or $XTI \div 2$.

The LRIP pin is used to select the polarity used for the audio input left/right clock, LRCIN.

Finally, the RESV pin is not used by the current DF1704 design, but is reserved for future use.

Software Mode Controls

With MODE = H, the DF1704 may be configured by programming four internal registers in software mode. ML (pin 13), MC (pin 12), and MD (pin 11) make up the 3-wire software control port, and may be controlled using DSP or microcontroller general purpose I/O pins, or a serial port. Table V provides an overview of the internal registers, labeled MODE0 through MODE3.

FIGURE 8. Internal Mode Control Registers.

FIGURE 9. Software Interface Format.

FIGURE 10. Software Interface Timing Requirements.

MODE0 Register

The MODE0 register is used to set the attenuation data for the Left output channel, or DOL (pin 24).

When ATC = 1 (Bit B2 of Register MODE3 = 1), the Left channel attenuation data AL[7:0] is used for both the Left and Right channel attenuators.

When ATC = 0, (Bit B2 of Register MODE3 = 0), Left channel attenuation data is taken from AL[7:0] of register MODE0, and Right channel attenuation data is taken from AR[7:0] of register MODE1.

AL[7:0] Left Channel Attenuator Data, where AL7 is the MSB and AL0 is the LSB.

Attenuation Level is given by:

$$\text{ATTEN} = 0.5 \cdot (\text{DATA} - 255)\text{dB}$$

For DATA = FFh, ATTEN = -0dB

For DATA = FEh, ATTEN = -0.5dB

For DATA = 01h, ATTEN = -127.5dB

For DATA = 00h, ATTEN = infinity = Mute

LDL Left Channel Attenuation Data Load Control. This bit is used to simultaneously set attenuation levels of both the Left and Right channels.

When LDL = 1, the Left channel output level is set by the data in AL[7:0]. The Right channel output level is set by the data in AL[7:0], or the most recently programmed data in bits AR[7:0] of register MODE1.

When LDL = 0, the Left channel output data remains at its previously programmed level.

MODE1 Register

The MODE1 register is used to set the attenuation data for the Right output channel, or DOR (pin 23).

When ATC = 1 (Bit B2 of Register MODE3 = 1), the Left channel attenuation data AL[7:0] of register MODE0 is used for both the Left and Right channel attenuators.

When ATC = 0, (Bit B2 of Register MODE3 = 0), Left channel attenuation data is taken from AL[7:0] of register MODE0, and Right channel attenuation data is taken from AR[7:0] of register MODE1.

AR[7:0] Right Channel Attenuator Data, where AR7 is the MSB and AR0 is the LSB. Attenuation Level is given by:

$$\text{ATTEN} = 0.5 \cdot (\text{DATA} - 255)\text{dB}$$

For DATA = FFh, ATTEN = -0dB

For DATA = FEh, ATTEN = -0.5dB

For DATA = 01h, ATTEN = -127.5dB

For DATA = 00h, ATTEN = infinity = Mute

LDR Right Channel Attenuation Data Load Control. This bit is used to simultaneously set attenuation levels of both the Left and Right channels.

When LDR = 1, the Right channel output level is set by the data in AR[7:0], or by the data in bits AL[7:0] of register MODE0. The Left channel output level is set to the most recently programmed data in bits AL[7:0] of register MODE0.

When LDR = 0, the Right channel output data remains at its previously programmed level.

MODE2 Register

The MODE2 register is used to program various functions:

MUT Soft Mute Function.
When MUT = 0, Soft Mute is ON for both Left and Right channels.
When MUT = 1, Soft Mute is OFF for both Left and Right channels.

DEM Digital De-Emphasis Function.
When DEM = 0, de-emphasis is OFF.
When DEM = 1, de-emphasis is ON.

IW[1:0] Input Data Format and Word Length.

I ² S	IW1	IW0	Description
0	0	0	16-Bit Data, Standard Format (MSB-First, Right-Justified)
0	0	1	20-Bit Data, Standard Format
0	1	0	24-Bit Data, Standard Format
0	1	1	24-Bit Data, MSB-First, Left-Justified
1	0	0	16-Bit Data, I ² S Format
1	0	1	24-Bit Data, I ² S format
1	1	0	Reserved
1	1	1	Reserved

OW[1:0] Output Data Word Length.

OW1	OW0	Description
0	0	16-Bit Data, MSB-First
0	1	18-Bit Data, MSB-First
1	0	20-Bit Data, MSB-First
1	1	24-Bit Data, MSB-First

MODE3 Register

The MODE3 register is used to program various functions.

I²S Input Data Format.
When I²S = 0, standard or left-justified formats are enabled.
When I²S = 1, the I²S formats are enabled.

LRP LRCIN Polarity Selection.
When LRP = 0, Left channel is HIGH and Right channel is LOW.
When LRP = 1, Left channel is LOW and Right channel is HIGH.

ATC Attenuator Control.
This bit is used to determine whether the Left and Right channel attenuators operate with independent data, or use common data (the Left channel data in bits AL[7:0] of register MODE0).
When ATC = 0, the Left and Right channel attenuator data is independent.
When ATC = 1, the Left and Right channel attenuators use common data.

SRO Digital Filter Roll-Off Selection.
When SRO = 0, sharp roll-off is selected.
When SRO = 1, slow roll-off is selected.

CKO CLKO Output Frequency Selection.
When CKO = 0, the CLKO frequency is the same as the clock at the XTI input.
When CKO = 1, the CLKO frequency is half of the XTI input clock frequency.

SF[1:0] Sampling Frequency Selection for the De-Emphasis Function.

SF1	SF0	Description
0	0	44.1 kHz
0	1	Reserved
1	0	48 kHz
1	1	32 kHz

APPLICATIONS INFORMATION

PCB LAYOUT GUIDELINES

In order to obtain the specified performance from the DF1704 and its associated DACs, proper printed circuit board layout is essential. Figure 11 shows two approaches for obtaining the best audio performance.

Figure 11(a) shows a standard, mixed signal layout scheme. The board is divided into digital and analog sections, each with its own ground. The ground areas should be put on a split-plane, separate from the routing and power layers. The DF1704 and all digital circuitry should be placed over the digital section, while the audio DACs and analog circuitry should be located over the analog section of the board. A common connection between the digital and analog grounds is required and is done at a single point as shown.

For Figure 11(a), digital signals should be routed from the DF1704 to the audio DACs using short, direct connections to reduce the amount of radiated high-frequency energy. If necessary, series resistors may be placed in the clock and data signal paths to reduce or eliminate any overshoot or undershoot present on these signals. A value of 50Ω to 100Ω is recommended as a starting point, but the designer should experiment with the resistor values in order to obtain the best results.

Figure 11(b) shows an improved method for high performance, mixed signal board layout. This method adds digital isolation between the DF1704 and the audio DACs, and

provides complete isolation between the digital and analog sections of the board. Texas Instrument's ISO150 dual digital coupler provides excellent isolation, and operates at speeds up to 80Mbps.

POWER SUPPLIES AND BYPASSING

The DF1704 requires a single +5V power supply for operation. The power supply should be bypassed by a $10\mu\text{F}$ and $0.1\mu\text{F}$ parallel capacitor combination. The capacitors should be placed as close as possible to V_{DD} (pin 22). Aluminum electrolytics or tantalum capacitors can be used for the $10\mu\text{F}$ value, while ceramics may be used for the $0.1\mu\text{F}$ value.

BASIC CIRCUIT CONNECTIONS

Figures 12 and 13 show basic circuit connections for the DF1704. Figure 12 shows connections for Hardware mode controls, while Figure 13 shows connections for Software mode controls. Notice the placement of C_1 and C_2 in both figures, as they are physically close to the DF1704.

TYPICAL APPLICATIONS

The DF1704 will typically be used in high-performance audio equipment, in conjunction with high-performance audio DACs. Figure 14 shows a typical application circuit example, employing the DF1704, a digital audio receiver, and two PCM1704 24-bit, 96kHz audio DACs.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DF1704E	NRND	SSOP	DB	28	47	RoHS & Green	NIPDAU	Level-1-260C-UNLIM		DF1704E	

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
