

2.4GHz Up/Down Converter

The Harris 2.4GHz PRISM™ chip set is a highly integrated five-chip solution for RF modems employing Direct Sequence Spread Spectrum (DSSS) signaling. The HFA3624 RF/IF

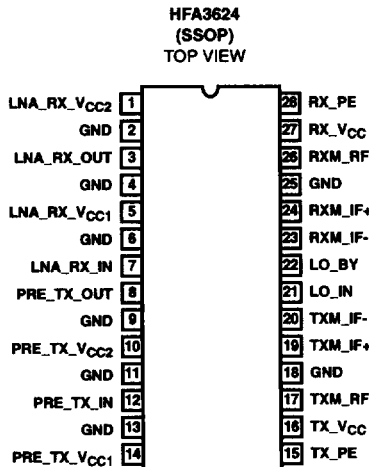

converter is one of the five chips in the PRISM™ chip set (see Figure 1 for the typical application circuit).

The HFA3624 Up/Down converter is a monolithic bipolar device for up/down conversion applications in the 2.4GHz to 2.5GHz range. Manufactured in the Harris UHF1X process, the device consists of a low noise amplifier and down conversion mixer in the receive section and an up conversion mixer with power preamp in the transmit section. An energy saving power enable control feature assures isolation between the receive and transmit circuits for time division multiplexed systems. The device requires low drive levels from the local oscillator and is housed in a small outline 28 lead SSOP package ideally suited for PCMCIA card applications.

Ordering Information

PART NUMBER	TEMP. RANGE (°C)	PACKAGE	PKG. NO.
HFA3624IA	-40 to 85	28 Ld SSOP	M28.15
HFA3624IA96	-40 to 85	Tape and Reel	

Pinout

Features

- Complete Receive/Transmit Front End
- RF Frequency Range 2.4GHz to 2.5GHz
- IF Operation 10MHz to 400MHz
- Single Supply Battery Operation 2.7V to 5.5V
- Independent Receive/Transmit Power Enable Mode

Applications

- Systems Targeting IEEE 802.11 Standard
- PCMCIA Wireless Transceiver
- Wireless Local Area Network Modems
- TDMA Packet Protocol Radios
- Part 15 Compliant Radio Links
- Portable Battery Powered Equipment

Block Diagram

HFA3624

NOTE: Required for systems targeting 802.11 Specifications.

FIGURE 1. TYPICAL TRANSCEIVER APPLICATION CIRCUIT USING THE HFA3624

For additional information on the PRISM™ chip set, call (407) 724-7800 to access Harris' AnswerFAX system. When prompted, key in the four-digit document number (File #) of the datasheets you wish to receive.

The four-digit file numbers are shown in Figure 1, and correspond to the appropriate circuit.

HFA3624

Absolute Maximum Ratings

Supply Voltage -0.3V to +6.0V
 Voltage on Any Other Pin -0.3 to $V_{CC} + 0.3V$

Operating Conditions

Supply Voltage Range 2.7V to 5.5V
 Temperature Range $-40^{\circ}C \leq T_A \leq 85^{\circ}C$

Thermal Information

Thermal Resistance (Typical, Note 1) θ_{JA} ($^{\circ}C/W$)
 28 Lead Plastic SSOP 88
 Package Power Dissipation at 70 $^{\circ}C$
 28 Lead Plastic SSOP 0.9W
 Maximum Junction Temperature 150 $^{\circ}C$
 Maximum Storage Temperature Range $-65^{\circ}C \leq T_A \leq 150^{\circ}C$
 Maximum Lead Temperature (Soldering 10s) 300 $^{\circ}C$
 (SSOP - Lead Tips Only)

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

1. θ_{JA} is measured with the component mounted on an evaluation PC board in free air.

Electrical Specifications $V_{CC} = +2.7V$, LO = 2170MHz, IF = 280MHz, RF = 2450MHz, $Z_O = 50\Omega$, Unless Otherwise Specified

NOTES:

- See Figure 5 Test Circuit for 50Ω IF matching network component values.
- SSB (Single Side Band) Noise Figure measurement requires the use of an IF Reject/Highpass Filter between the Noise Source and the RXM_RF port. This filter prevents IF input noise from interfering with the Mixer IF output Noise Figure Measurement.
- Transmit mixer measured with Impedance Transform Network 250Ω at device to 50Ω at the source. Refer to Figure 5, pin 19.
- Implied limit, production measurement uses 50Ω termination at pin 19 (RSIF = 50Ω). Typical transmit conversion gain increase of 5.5dB with application circuit Figure 5 (RSIF = 250Ω).
- See Figure 2 for Typical Application Circuit.
- Enable/Disable Time Specifications are tested with the external component values shown in the Figure 5 Test Circuit, with an IF frequency of 280MHz. Specifically the AC coupling capacitors on the TXM_IF+ and TXM_IF- pins are biased up to operating voltage from a fixed internal current source at power up. Increasing these AC coupling capacitors above 1000pF will slow Enable Time proportionately.

Pin Descriptions

PINS	SYMBOL	DESCRIPTION
1	LNA_RX_VCC2	Receive Channel Low Noise Amplifier Output Stage Positive Power Supply. Use high quality decoupling capacitors right at the pin. A 5pF chip capacitor is recommended.
3	LNA_RX_OUT	Receive Channel Low Noise Amplifier Output (2400MHz to 2500MHz). The nominal impedance of 50Ω, over the operating frequency range, is achieved with an on chip narrowband tuned circuit. This pin requires AC coupling.
5	LNA_RX_VCC1	Receive Channel Low Noise Amplifier Input Stage Positive Power Supply. Use high quality decoupling capacitors right at the pin. A 200pF chip capacitor is recommended.
7	LNA_RX_IN	Receive Channel Low Noise Amplifier Input (2400MHz to 2500MHz). The nominal impedance of 50Ω, over the operating frequency range, is achieved with an on chip narrowband tuned circuit. This pin requires AC coupling.
8	PRE_TX_OUT	Transmit Channel Power Pre-Amplifier Output (2400MHz to 2500MHz). The nominal impedance of 50Ω, over the operating frequency range, is achieved with on chip narrowband tuned circuit. This pin requires AC coupling.
10	PRE_TX_VCC2	Transmit Channel Power Pre-Amplifier Output Stage Positive Power Supply. Use high quality decoupling capacitors right at the pin. A 200pF chip capacitor is recommended.
12	PRE_TX_IN	Transmit Channel Power Pre-Amplifier Input (2400MHz to 2500MHz). The nominal impedance of 50Ω, over the operating frequency range, is achieved with an on chip narrowband tuned circuit. This pin requires AC coupling.
14	PRE_TX_VCC1	Transmit Channel Power Pre-Amplifier Input Stage Positive Power Supply. Use high quality decoupling capacitors right at the pin. A 200pF chip capacitor is recommended.
15	TX_PE	Transmit Channel Power Enable Control Input. TTL compatible input. Refer to "Power Control Truth Table" on previous page.
16	TX_VCC	Transmit Channel Positive Power Supply. Use high quality decoupling capacitors right at the pin. A 200pF chip capacitor is recommended.
17	TXM_RF	Transmit Channel Mixer RF Output (2400MHz to 2500MHz). The nominal impedance of 50Ω, over the operating frequency range, is achieved with an on chip narrowband tuned circuit. This pin requires AC coupling.
19	TXM_IF+	Transmit Channel Mixer IF+ Input (10MHz to 400MHz). The TXM_IF+ and TXM_IF- pins form a high input impedance differential pair. Either input (or both inputs for special applications) may be used for the IF signal. Typically the TXM_IF- pin is bypassed to ground with a 470pF capacitor and the TXM_IF+ pin is AC coupled to the transmit IF signal. The high impedance input requires external termination. The specified input impedance is modeled as a resistor in parallel with a capacitor derived from S parameters at 280MHz. The input impedance will increase at lower IF frequencies. This pin requires AC coupling. Increasing the AC coupling capacitor to larger than 1000pF will degrade Transmit Enable Time.
20	TXM_IF-	Transmit Channel Mixer IF- Input (10MHz to 400MHz). The TXM_IF+ and TXM_IF- pins form a high input impedance differential pair. Either input (or both for special applications) may be used for the IF signal. Typically the TXM_IF- pin is bypassed to ground with a 470pF capacitor and the TXM_IF+ pin is AC coupled to the transmit IF signal. The high impedance input requires external termination. The specified input impedance is modeled as a resistor in parallel with a capacitor derived from S parameters at 280MHz. The input impedance will increase at lower IF frequencies. This pin requires AC coupling. Increasing the AC coupling capacitor to larger than 1000pF will degrade Transmit Enable Time.
21	LO_IN	Local Oscillator Input (2000MHz to 2490MHz). The LO_IN and LO_BY pins form a differential pair with a mutual broadband 50Ω impedance. Refer to the LO_BY pin for details. The recommended LO power is -3dBm, however usable performance is obtained for the range -6dBm to +3dBm. The LO_IN pin requires AC coupling.
22	LO_BY	Local Oscillator Input Bypass (2000MHz to 2490MHz). The LO_IN and LO_BY pins form a differential pair with a mutual broadband 50Ω input impedance. The LO_BY pin can be used as a signal input, but may have slightly degraded performance due to a clamp circuit to GND. Typically the LO_BY pin is bypassed to GND with a 5pF capacitor. The LO_BY pin requires AC coupling.

Pin Descriptions (Continued)

PINS	SYMBOL	DESCRIPTION
23	RXM_IF-	Receive Channel Mixer IF- Output (10MHz to 400MHz). The RXM_IF+ and RXM_IF- pins form a complementary open collector output driver pair. The open collector outputs require an external load to V_{CC} not to exceed 500 Ω , for the Single Ended IF case shown in Figure 3, or 1k Ω for the Differential IF cases shown in Figures 2 and 4. This pin requires AC coupling.
24	RXM_IF+	Receive Channel Mixer IF+ Output (10MHz to 400MHz) The RXM_IF+ and RXM_IF- pins form a complementary open collector output driver pair. The open collector outputs require an external load to V_{CC} not to exceed 500 Ω , for the Single Ended IF case shown in Figure 3, or 1k Ω for the Differential IF cases shown in Figures 2 and 4. This pin requires AC coupling.
26	RXM_RF	Receive Channel Mixer RF Input (2400MHz to 2500MHz). The nominal impedance of 50 Ω , over the operating frequency range, is achieved with an on chip narrowband tuned circuit. This pin requires AC coupling.
27	RX_VCC	Receive Channel Positive Power Supply. Use high quality decoupling capacitors right at the pin. A 200pF chip capacitor is recommended.
28	RX_PE	Receive Channel Power Enable Control Input. TTL compatible input. Refer to "Power Control Truth Table" on previous page.
2, 4, 6, 9, 11, 13, 18, 25	GND	Circuit Ground Pins (Qty 8). Internally connected.
