

GESTURE SENSOR KIT

UDOO Bricks are modules you can use to augment your UDOO boards and make them more versatile. Attach them into I2C snap-in connector with the related cable. UDOO Bricks work along a cascade configuration, so you can attach them all together without wasting space in a truly intuitive way. Thanks to such configuration you can use cables up to 3,5 m long to connect UDOO Bricks one another.

The Gesture Sensor Kit is composed of a Gesture Sensor Brick and a cable for the cascade configuration. It enables gesture recognition applications. It is based on the PAJ7620U2.
