PRODUCT SPECIFICATION

5.0 Test Requirements and Procedures.

5.1 ELECTRICAL REQUIREMENTS

	DESCRIPTION	TEST CONDITION	REQUIREMENT
5.1.1	Insulation Resistance	EIA 364-21 After 500 VDC for 1 minute, measure the insulation resistance between the adjacent contacts of mated and unmated connector assemblies.	1000 Mega ohms MINIMUM
5.1.2	Dielectric Withstanding Voltage	EIA 364-20 Method B Test between adjacent contacts of mated and unmated connector assemblies.	The dielectric shall withstand 500 VAC for 1 minute sea level
5.1.3	Contact Resistance (LLCR)	EIA 364-23 Subject mated contacts assembled in housing to 20 mV maximum open circuit at 100 mA maximum.	1. Initially 30 milliohms Max. 2. Resistance increased 15 milliohms Max. after stress
5.1.4	Mated connector impedance (Signal Port)	1). Set the Time Domain Reflectometer (TDR) pulsers in differential mode with a positive going (V+) and a negative going pulse (V-). Define a reflected differential trace: $V_{diff} = V+ - V-$ 2). With the TDR connected to the risetime reference trace, verify an input risetime of 70 ps (measured 20% - 80% Vp). Filtering may be used to slow the system down (see NOTE 2) 3). Connect the TDR to the sample measurement traces. Calibrate the instrument and system (see NOTE 3). 4). Measure and record the maximum and minimum values of the near end connector impedance.	100 ohm +/- 15%
5.1.5	Contact current rating (Power segment)	1. Mount the connector to a test PCB 2. Wire power pins P2, P3, P5 and P6 in parallel for power 3. Wire ground pins P1, P4 and P7 in parallel for return 4. Supply 6A total DC current to the power pins in parallel, returning from the parallel ground pins (P1, P4 and P7) 5. Record temperature rise when thermal equilibrium is reached	1.5A per pin MINIMUM. The temperature rise above ambient shall not exceed 30 °C at any point in the connector when contact positions are powered. The ambient condition is still air at 25 °C.

NOTES-

1. Time domain measurement equipment allows for delay adjustment of the pulses so launch times can be synchronized. Frequency domain equipment will require the use of phase matched fixturing. The fixturing skew should be verified to be <1 ps on a TDR.
2. The system rise time is to be set via equipment filtering techniques. The filter risetime is significantly close to the stimulus risetime. Therefore the filter programmed equals the square root of $(t_{r(observable)})^2 - (t_{r(stimulus)})^2$. After filtering, verify the risetime is achieved using the risetime reference traces on the PCB fixture.
3. Calibrate the system by substituting either precision 50-ohm loads or precision air lines (also terminated in 50 ohm loads) for the test fixture. This places the calibration plane directly at the input interface of the test fixture.

5.2 MECHANICAL REQUIREMENTS
