

Low Dropout Voltage Regulator

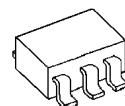

■ GENERAL DESCRIPTION

The NJM2878 is a 150mA output low dropout voltage regulator with ON/OFF control.

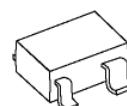

Advanced bipolar technology achieves low noise, high ripple rejection, high accuracy and low quiescent current.

Small packaging (SC-88A/SC82AB) and very small packaging (ESON4), 0.47 μ F small decoupling capacitor and built-in noise bypass capacitor make the NJM2878 suitable for space conscious applications.

■ FEATURES

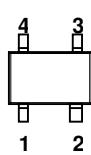

- High Ripple Rejection 75dB typ. ($f=1\text{kHz}$ $V_o=3\text{V}$ version)
- Output Noise Voltage $V_{no}=45\mu\text{Vrms}$ typ.
- Output capacitor with 0.47 μF ceramic capacitor ($V_o \geq 2.7\text{V}$ Version)
- Output Current $I_o(\text{max.})=150\text{mA}$
- High Precision Output $V_o \pm 1.0\%$
- Low Dropout Voltage 0.10V typ. ($I_o=60\text{mA}$)
- ON/OFF Control (Active High)
- Internal Thermal Overload Protection
- Internal Over Current Protection
- Bipolar Technology
- Package Outline SC88A(NJM2878F3) / SC82AB(NJM2878F4)) / ESON4-F1(NJM2878KF1)

■ TEST CIRCUIT

*5 : $1.8V < V_{O} \leq 2.6V$ version: $C_O = 1.0\mu F$ (Ceramic)
 $V_{O} \leq 1.8V$ version: $C_O = 2.2\mu F$ (Ceramic)

■ TYPICAL APPLICATION

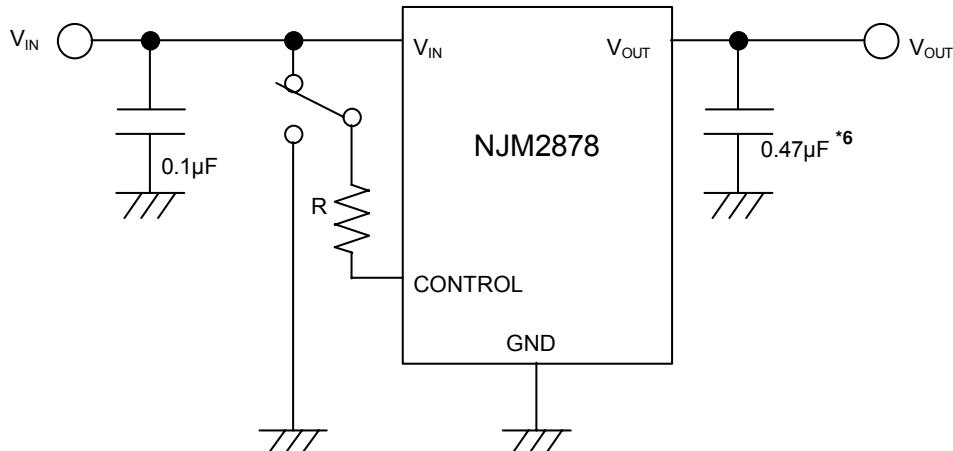

- ① In the case where ON/OFF Control is not required:

*6 : $1.8V < V_{O} \leq 2.6V$ version: $C_O = 1.0\mu F$
 $V_{O} \leq 1.8V$ version: $C_O = 2.2\mu F$

Connect control terminal to V_{IN} terminal

② In use of ON/OFF CONTROL:

*6 : 1.8V < Vo ≤ 2.6V version: Co = 1.0μF
 Vo ≤ 1.8V version: Co = 2.2μF

State of control terminal:

- “H” → output is enabled.
- “L” or “open” → output is disabled.

*Input Capacitance C_{IN}

Input Capacitance C_{IN} is required to prevent oscillation and reduce power supply ripple for applications with high power supply impedance or a long power supply line.

You should use the C_{IN} value of 0.1μF larger to avoid the problem.

C_{IN} should connect between GND and V_{IN} as **shortest path** as possible.

*In the case of using a resistance "R" between V_{IN} and control.

The current flow into the control terminal while the IC is ON state (I_{CONT}) can be reduced when a pull up resistance "R" is inserted between V_{IN} and the control terminal.

The minimum control voltage for ON state ($V_{CONT(ON)}$) is increased due to the voltage drop caused by I_{CONT} and the resistance "R". The I_{CONT} is temperature dependence as shown in the "Control Current vs. Temperature" characteristics. Therefore, the resistance "R" should be carefully selected to ensure the control voltage exceeds the $V_{CONT(ON)}$ over the required temperature range.

*Output Capacitance Co

Output capacitor (Co) **will be** required for a phase compensation of the internal error amplifier.

The capacitance and the equivalent series resistance (ESR) influence to **stable operation** of the regulator.

This product is designed to work with a low ESR capacitor (Co). However use of recommended capacitance or larger value is effective for stable operation.

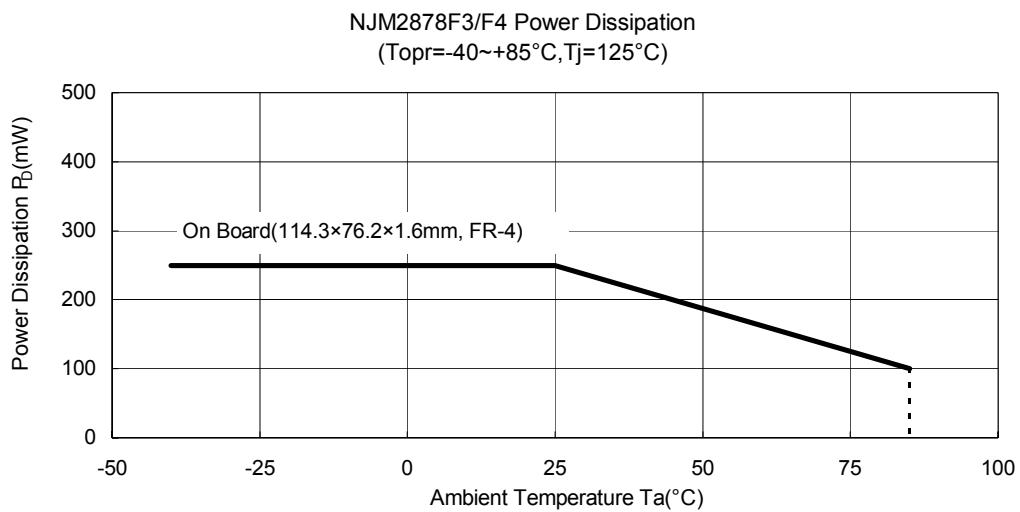

Use of a smaller Co may cause excess output noise or oscillation of the regulator due to lack of the phase compensation.

Therefore use Co with the recommended capacitance or **larger** value and connect between Vo terminal and GND terminal with shortest path. The recommended capacitance depends on the output voltage rank. Low voltage regulator requires **larger** value Co . Thus, check the recommended capacitance for each output voltage rank.

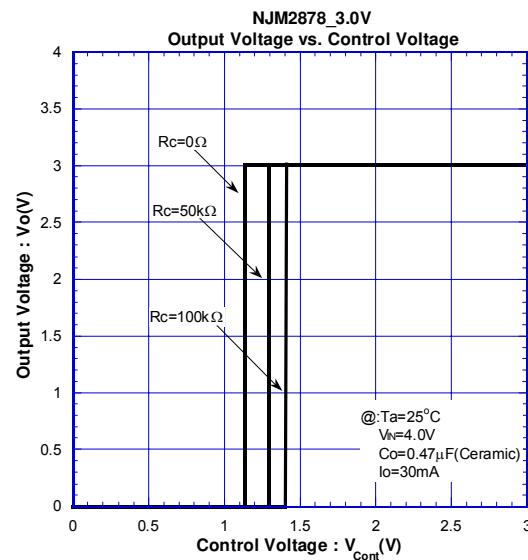

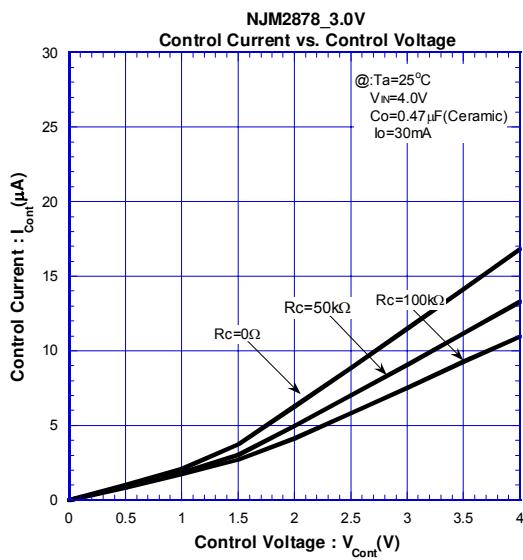

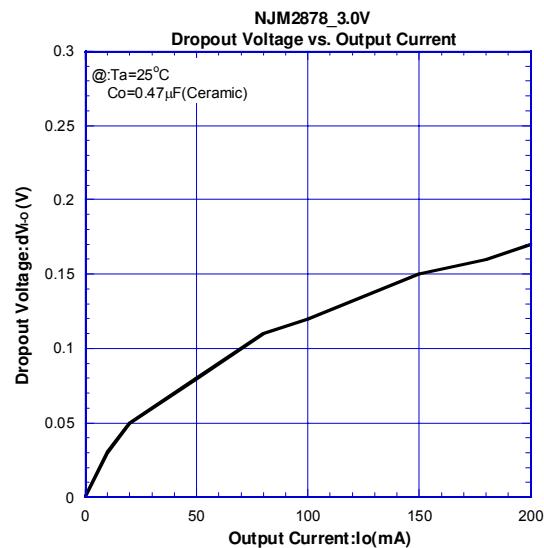

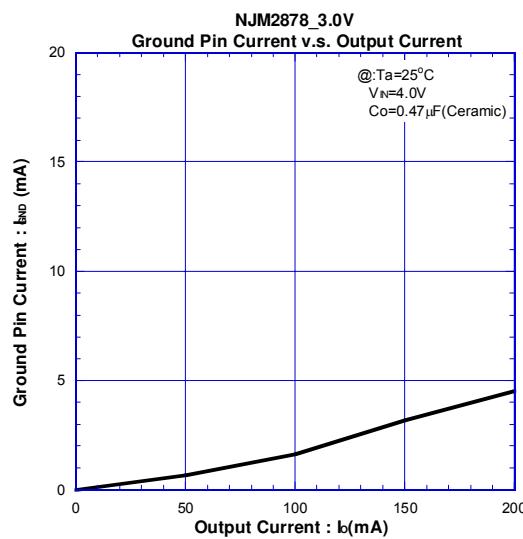

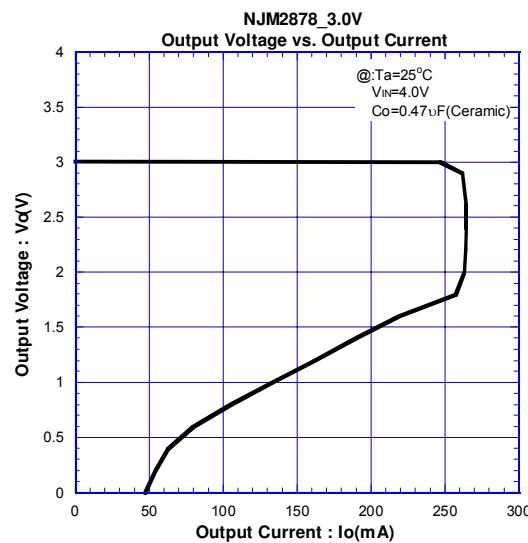

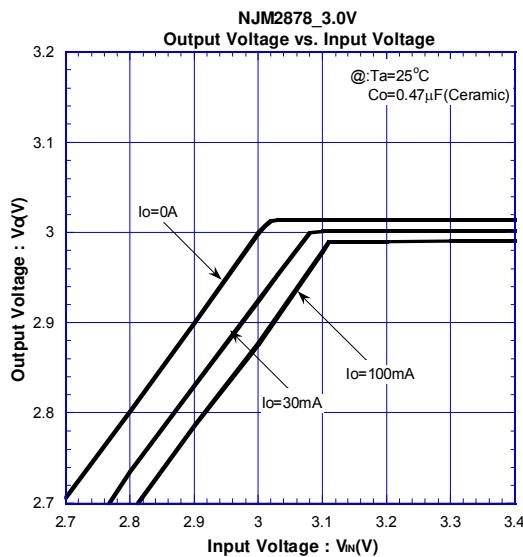

Use of a larger Co reduces output noise and ripple output, and also improves output transient response against rapid load change.
