

EMIRS200_AT01T_BR090

Thermal MEMS based infrared source

For direct electrical fast modulation

TO39 header with Reflector 1

■ Infrared Source

Axetris infrared (IR) sources are micro-machined, electrically modulated thermal infrared emitters featuring true blackbody radiation characteristics, low power consumption, high emissivity and a long lifetime. The appropriate design is based on a resistive heating element deposited onto a thin dielectric membrane which is suspended on a micro-machined silicon structure.

■ Infrared Gas Detection Applications

- **Measurement principles:** non-dispersive infrared spectroscopy (NDIR), photoacoustic infrared spectroscopy (PAS) or attenuated-total-reflectance FTIR spectroscopy (ATR)
- **Target gases:** CO, CO₂, VOC, NO_x, NH₃, SO_x, SF₆, hydrocarbons, humidity, anesthetic agents, refrigerants, breath alcohols
- **Medical:** Capnography, anesthesia gas monitoring, respiration monitoring, pulmonary diagnostics, blood gas analysis
- **Industrial Applications:** Combustible and toxic gas detection, refrigerant monitoring, flame detection, fruit ripening monitoring, SF₆ monitoring, semiconductor fabrication
- **Automotive:** CO₂ automotive refrigerant monitoring, alcohol detection & interlock, cabin air quality
- **Environmental:** Heating, ventilating and air conditioning (HVAC), indoor air quality and VOC monitoring, air quality monitoring

■ Features

- Large modulation depth at high frequencies
- Broad band emission
- Low power consumption
- Long lifetime
- True black body radiation (2 to 14 μm)
- Very fast electrical modulation (no chopper wheel needed)
- Suitable for portable and very small applications
- Rugged MEMS design

■ Absolute Maximum Ratings ($T_A = 22^\circ\text{C}$)

Parameter	Symbol	Rating	Unit
Heater membrane temperature ¹	T_M	500	$^\circ\text{C}$
Optical output power (hemispherical spectral) ($T_M = 500^\circ\text{C}$)	P_{00}	39	mW
Optical output power between $4\ \mu\text{m}$ and $5\ \mu\text{m}$ ($T_M = 500^\circ\text{C}$)	P_{s4-5}	5.1	mW
Optical output power between $6\ \mu\text{m}$ and $8\ \mu\text{m}$ ($T_M = 500^\circ\text{C}$)	P_{s6-8}	7.0	mW
Optical output power between $8\ \mu\text{m}$ and $10\ \mu\text{m}$ ($T_M = 500^\circ\text{C}$)	P_{s8-10}	4.2	mW
Optical output power between $10\ \mu\text{m}$ and $13\ \mu\text{m}$ ($T_M = 500^\circ\text{C}$)	P_{s10-13}	3.5	mW
Electrical cold resistance (at $T_M = T_A = 22^\circ\text{C}$)	R_{C22}	35 to 55	Ω
Electrical operating (hot) resistance ² (at $T_M = 500^\circ\text{C}$ with $f \geq 5\ \text{Hz}$ and $t_{on} \geq 8\ \text{ms}$)	R_{H500C}	$1.883 * R_{C22} - 12.02$	Ω
Package temperature	T_P	80	$^\circ\text{C}$
Storage temperature	T_S	-20 to +85	$^\circ\text{C}$
Ambient temperature ³ (operation)	T_A	-40 to +125	$^\circ\text{C}$
Heater area	A_H	2.1×1.8	mm^2
Frequency ⁴	f	5 to 50	Hz

Note: Emission power in this table is defined by hemispherical radiation. Stress beyond those listed under “absolute maximum ratings” may cause permanent damage to the device.

Note: Diagram $R_{H500C} - R_{C22} \mid (T_M = 500^\circ\text{C})$

How to ensure that the maximum temperature for T_M is not exceeded:

1. Determine electrical cold resistance R_C of the EMIRS device at $T_A = 22^\circ\text{C}$
2. Ensure that anytime R_H does not exceed the representative limit as shown in this diagram with respect to these conditions:
 - a. $f \geq 5\ \text{Hz}$
 - b. on-time (pulse duration) $\geq 8\ \text{ms}$

Electrical operating (hot) resistance R_H versus electrical cold resistance R_{C22} at $T_A = 22^\circ\text{C}$

¹ Temperatures above 500°C will impact drift and lifetime of the devices.

² See Diagram $R_H - R_C \mid (T_M = 500^\circ\text{C})$

³ The environmental and package temperature might impact the lifetime and characteristic of the devices.

⁴ Lower cut-off frequency of 5 Hz for designed thermodynamic state.

■ Ratings at Reference Operation (RO¹ T_A = 22°C)

Parameter	Symbol	Rating	Unit
Heater membrane temperature	T _M	< 500	°C
Duty cycle of rectangular V _H pulse	D	62	%
Frequency of rect. pulse shape ²	f _{ref}	5	Hz
On time constant of integral emissive power P ₀₀	τ _{on}	18	ms
Off time constant of integral emissive power P ₀₀	τ _{off}	8	ms
Package temperature at T _A = 22°C	T _P	40 to 85	°C

Note: First order on-time model using τ_{on}:

First order off-time model using τ_{off}:

Relative rectangular heater voltage (V_H) pulse with a relative pulse width of 124 ms at 5 Hz
(time description of reference operation RO¹)

Optical response time (relative optical output power P₀₀) of a rectangular voltage pulse (RO¹ conditions)

¹ Reference Operation: combines lower cut-off frequency of 5 Hz and maximum modulation depth (max-min signal)

² Recommended frequencies from 5 Hz to 50 Hz

■ Typical Timing Characteristics Frequency (D = 62%)

Relative (to RO) max, min, max-min values of optical output power (P_{00}) versus frequency f with fixed and compensated V_H

Relative (to RO) electrical drive values heater voltage V_H and power P_H versus frequency f for compensation

Note: Diagrams a, b

Relative P_{00}, V_H, P_H to reference operation (RO)

$f=5$ Hz, rect. pulse $D=62\%$

max: maximum value of P_{00} response shape

min: minimum value of P_{00} response shape

max-min: amplitude calculation of P_{00} resp. shape

Fixed V_H : same voltage for all frequencies.

Compensated V_H : for every frequency value, the voltage is adjusted to achieve the same maximum of P_{00} response shape as for 5 Hz.

■ Typical Timing Characteristics Pulse Duration D^1 ($f = 50$ Hz)

Relative (to $D=62\%$) max, min, max-min values of optical output power (P_{00}) versus duty cycle D with fixed and compensated V_H

Relative (to RO) electrical drive values heater voltage V_H and power P_H versus duty cycle D for compensation

Note: Diagrams a, b

Relative P_{00}, V_H, P_H to reference operation (RO)
 $f=50$ Hz, rect. voltage pulse

max: maximum value of P_{00} response shape

min: minimum value of P_{00} response shape

max-min: amplitude calculation of P_{00} resp. shape

Fixed V_H : same voltage for all frequencies.

Compensated V_H : for every frequency value, the voltage is adjusted to achieve the same maximum of P_{00} response shape as for $D=62\%$.

¹ Effective D shorter than 30% and voltage or power compensation at high frequencies (e.g. 20% @ 50 Hz) might impact the lifetime and characteristic of the devices because of additional stress in material layers.

■ Typical electrical/thermal characteristics (RO, $T_A = 22^\circ\text{C}$)

Parameter	Symbol	Rating	Unit
Peak chip membrane temperature	T_M	460/500	$^\circ\text{C}$
Heater voltage	V_H	5.23/5.66	V
Heater power	P_H	394/446	mW

Mean¹ and upper bound of heater voltage V_H vs. cold resistance R_{C22}

Relative change of membrane temperature (T_M) by changing heater voltage (V_H)

Mean¹ and upper bound of heater power P_H vs. cold resistance R_{C22}

Relative change membrane temperature (T_M) by changing heater power (P_H)

¹ Recommended operation mode $T_M = 460^\circ\text{C}$, which ensures 95% confidence that the maximum temperature $T_M = 500^\circ\text{C}$ is not exceeded.

■ Typical Optical Characteristics (RO, $T_A = 22^\circ\text{C}$)

Hemispherical spectral emissive power of EMIRS200 chip surface with a typical emissivity (mean from 2 to 14 μm) of $\epsilon = 0.85$

Optical output power (P_{00}) versus distance d of a 1 mm² detection surface at 500°C T_M

Optical output power (P_{00}) versus opening angle α_0 (integral rotation of a cone) at 500°C T_M

Relative change of optical output power (P_{00}) by changing heater voltage (V_H)

Relative change of optical output power (P_{00}) by changing heater power (P_H)
