

Using the TLC694x VQFN Evaluation Module

This user's guide describes operational use of the TLC694x VQFN package evaluation module (BOOSTXL-TLC6948EVM) as a reference for engineering demonstration and evaluation of the TLC694x 16-channel, 32-, 48-multiplexing, 16-bit ES-PWM constant-current LED driver. Included in this user's guide are setup instructions, a schematic diagram, printed circuit board (PCB) layout, and a bill of materials (BOM).

1 Introduction

1.1 Features

The TLC694x device is a 16-channel, constant-current-sink LED driver. Each channel has an individually-adjustable 65,536 steps of PWM grayscale control. The maximum constant-current value of all 16 channels is set by a single external resistor with 7-bit (128 steps) global brightness control from 0.3 mA to 25 mA. The BOOSTXL-TLC6948EVM uses three TLC6946 VQFN package devices to drive 16 RGB LEDs, each device controlling one color. Moreover, the EVM provides the function to verify the LED-open detection (LOD) and IREF resistor short protection (ISP).

1.2 Applications

The BOOSTXL-TLC6948EVM can be used as a basic function evaluation module for the following applications:

- Mono-color, multi-color, full-color LED displays
- High-refresh-rate LED video displays
- High-density, fine-pitch LED matrix boards
- LED sign boards, message boards
- Variable message signs (VMS)

2 Test Setup and Results

This section describes the BOOSTXL-TLC6948EVM connectors, test points, and jumpers.

2.1 BOOSTXL-TLC6948EVM Board

Figure 1 displays the EVM board.

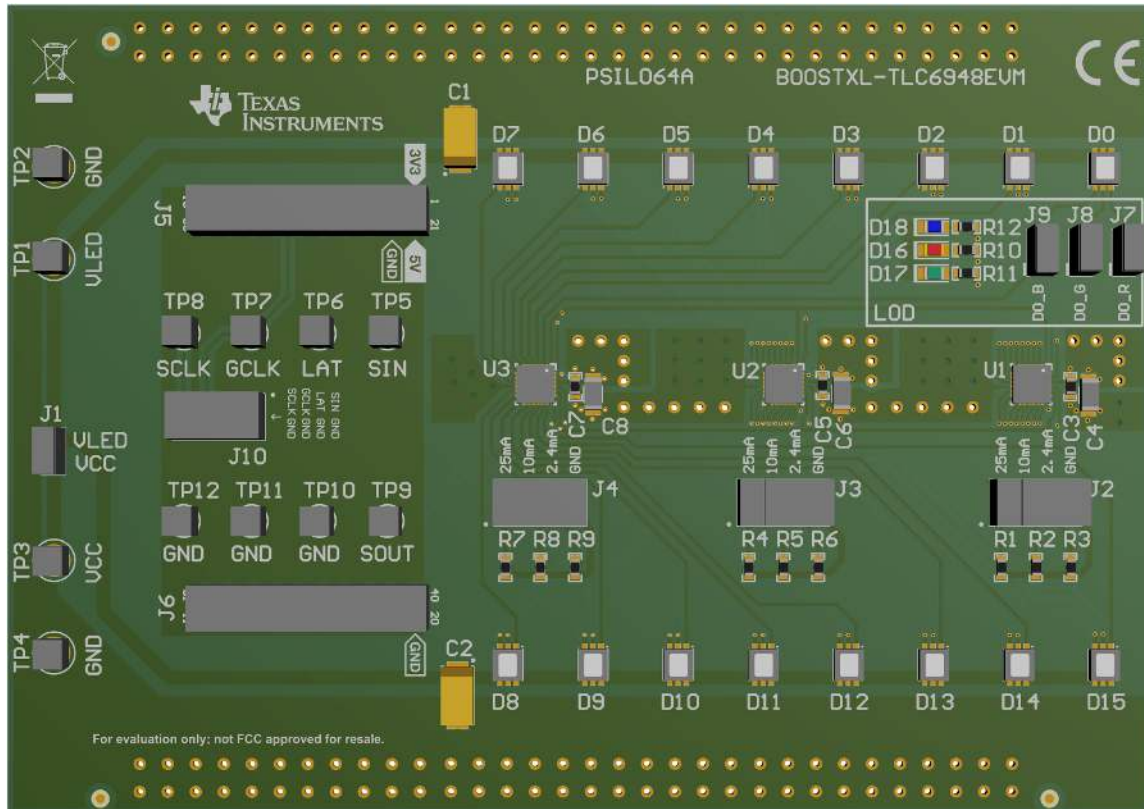

Figure 1. BOOSTXL-TLC6948EVM Board

2.2 Connectors

The EVM has the following connectors:

- TP1 (VLED): Input power supply for VLED
- TP3 (VCC): Input power supply for VCC
- TP2 or TP4 (GND): Supply ground

2.3 Test Points

All the signal pins on the TLC694x device have test points on the EVM, helping users to observe the waveform on the pins, including SCLK, GCLK, LAT, SIN, and SOUT. The EVM also offers extra GND test points for connections.

2.4 Jumpers

2.4.1 VCC and VLED Connection Jumpers – J1

Jumper J1 is used to connect VCC and VLED. With a shunt, the EVM uses the same power supply for VCC and VLED.

2.4.2 IREF Set Jumpers - J2, J3, and J4

Jumpers J2, J3, and J4 are used to select different maximum constant-output sink current or ISP function verification. [Table 1](#) contains the definitions for jumpers J2 to J4.

Table 1. Jumpers J2–J4

JUMPER POSITION	WITH SHUNT FUNCTION
25 mA	Set maximum constant-output sink current to 25 mA
10 mA	Set maximum constant-output sink current to 10 mA
2.4 mA	Set maximum constant-output sink current to 2.4 mA
GND	Connect IREF with GND to verify IREF Resistor Short Protection (ISP)

2.4.3 Signal Input Jumpers - J5, J6, and J10

This BOOSTXL-TLC6948EVM provides BoosterPack connector J5 and J6 to connect with the MSP-EXP432P401R LaunchPad™ for a quick software start.

To use other controllers or data generator, the signals can be input through J10.

2.4.4 LOD Function Verification Jumpers – J7, J8, and J9

Jumpers J7–J9 are used to verify the LED-Open Detection (LOD) function. Using the MSP-EXP432P401R LaunchPad to drive the EVM, D16–D18 can work as indicators for LOD. If using other controllers or data generator, the LOD data can be read from SOUT (TP9). [Table 2](#) contains the definitions for jumpers J7–J9.

Table 2. Jumpers J7–J9

DESIGNATOR	ATTACHED FUNCTION	WITHOUT SHUNT RESULT
J7	LOD for LED D0 Red	LED D0 red is open and D16 turns ON if using MSP-EXP432P401R LaunchPad configuration
J8	LOD for LED D0 Green	LED D0 green is open and D17 turns ON if using MSP-EXP432P401R LaunchPad configuration
J9	LOD for LED D0 Blue	LED D0 blue is open and D18 turns ON if using MSP-EXP432P401R LaunchPad configuration

3 Test Setup

[Table 3](#) shows the typical parameters for the BOOSTXL-TLC6948EVM. [Table 3](#) contains the BOOSTXL-TLC6948EVM parameters.

Table 3. BOOSTXL-TLC6948EVM Parameters

PARAMETER	VALUE
Input voltage for VCC	3 V to 5.5 V
Input voltage for VLED	17 V maximum
Input Current for VLED	1.2-A maximum

Follow these steps for the EVM test setup:

- Using J1 to select whether using the same power supply for VCC, VLED. Set the voltage of the DC power supply for VCC and VLED and set the current limit to 1.5 A.
- Connect the positive and negative outputs of the power supply to connectors VCC, VLED, and GND on the EVM board.
- Select the positions of J2–J4 and make sure J7 to J9 have shunts.
- Connect the MSP-EXP432P401R LaunchPad with the EVM through J5 and J6.

5. Power up the VCC and VLED and send the signal to change LED status and check LOD and ISP functions.

4 Board Layout

Figure 2 illustrates the EVM board layout.
