## Monolithic 4 Amp DC/DC Step-Down Regulator

The EL7563 is an integrated, full-featured synchronous step-down regulator with output voltage adjustable from 1.0V to 2.5V. It is capable of delivering 4A continuous current at up to 95% efficiency. The EL7563 operates at a constant frequency pulse width modulation (PWM) mode, making external synchronization possible. Patented on-chip resistorless current sensing enables current mode control, which provides cycle-by-cycle current limiting, over-current protection, and excellent step load response. The EL7563 features power tracking, which makes the start-up sequencing of multiple converters possible. A junction temperature indicator conveniently monitors the silicon die temperature, saving the designer time on the tedious thermal characterization. The minimal external components and full functionality make this EL7563 ideal for desktop and portable applications.

The EL7563 is offered in 20-pin SO and 28-pin HTSSOP packages.

### Pinout

EL7563  
(20-PIN SO)  
TOP VIEW

### Features

- Integrated synchronous MOSFETs and current mode controller
- 4A continuous output current
- Up to 95% efficiency
- Internal patented current sense
- Cycle-by-cycle current limit
- 3V to 3.6V input voltage
- Adjustable output voltage 1V to 2.5V
- Precision reference
- ±0.5% load and line regulation
- Adjustable switching frequency to 1MHz
- Oscillator synchronization possible
- Internal soft-start
- Over-voltage protection
- Junction temperature indicator
- Over-temperature protection
- Under-voltage lockout
- Multiple supply start-up tracking
- Power-good indicator
- 20-pin SO (0.300") package
- 28-pin HTSSOP package
- Pb-Free available (RoHS compliant)

### Applications

- DSP, CPU core, and I/O supplies
- Logic/Bus supplies
- Portable equipment
- DC/DC converter modules
- GTL + Bus power supply

Typical Application Diagrams continued on page 3  
Manufactured Under U.S. Patent No. 5,7323,974

**Ordering Information**

PART NUMBER	PACKAGE	TAPE & REEL	PKG. DWG. #
EL7563CM	20-Pin SO (0.300")	-	MDP0027
EL7563CMZ (See Note)	20-Pin SO (0.300") (Pb-free)	-	MDP0027
EL7563CMZ-T13 (See Note)	20-Pin SO (0.300") (Pb-free)	13"	MDP0027

NOTE: Intersil Pb-free products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

**Absolute Maximum Ratings** ( $T_A = 25^\circ\text{C}$ )

Supply Voltage between $V_{IN}$ or $V_{DD}$ and GND	+4.5V	Storage Temperature	-65°C to +150°C
$V_{LX}$ Voltage	$V_{IN} + 0.3V$	Operating Ambient Temperature	-40°C to +85°C
Input Voltage	GND -0.3V, $V_{DD} + 0.3V$	Operating Junction Temperature	+135°C
$V_{HI}$ Voltage	GND -0.3V, $V_{LX} + 6V$		

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typical values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore:  $T_J = T_C = T_A$

**DC Electrical Specifications**  $V_{DD} = V_{IN} = 3.3V$ ,  $T_A = T_J = 25^\circ\text{C}$ ,  $C_{OSC} = 390pF$ , unless otherwise specified.

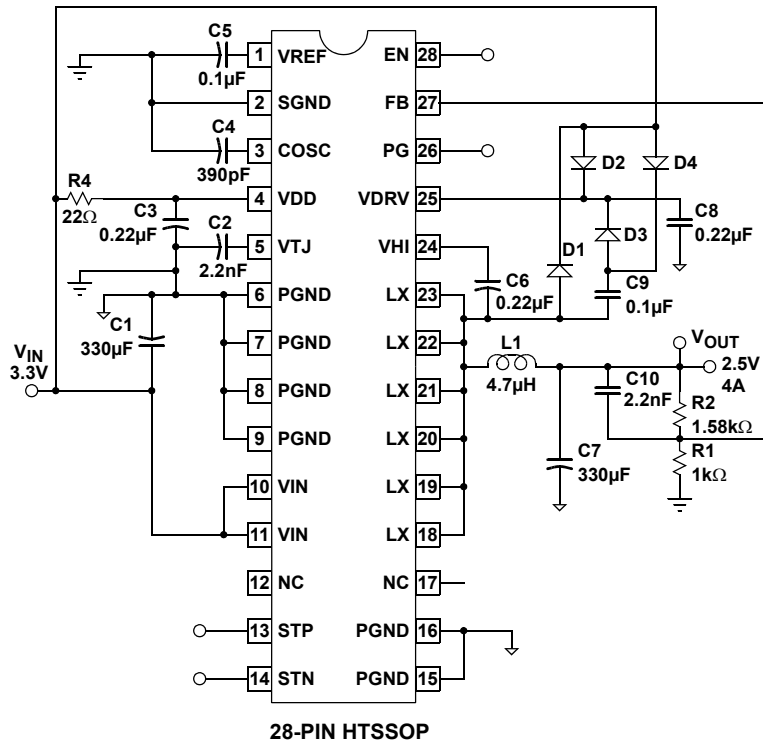

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNIT
$V_{REF}$	Reference Accuracy		1.24	1.26	1.28	V
$V_{REFTC}$	Reference Temperature Coefficient			50		ppm/°C
$V_{REFLOAD}$	Reference Load Regulation	$0 < I_{REF} < 50\mu A$	-1			%
$V_{RAMP}$	Oscillator Ramp Amplitude			1.15		V
$I_{OSC\_CHG}$	Oscillator Charge Current	$0.1V < V_{OSC} < 1.25V$		200		$\mu A$
$I_{OSC\_DIS}$	Oscillator Discharge Current	$0.1V < V_{OSC} < 1.25V$		8		mA
$I_{VDD+VDRV}$	$V_{DD}+V_{DRV}$ Supply Current	$V_{EN} = 2.7V$ , $F_{OSC} = 120kHz$	2	5.5	6.5	mA
$I_{VDD\_OFF}$	$V_{DD}$ Standby Current	$EN = 0$		1	1.5	mA
$V_{DD\_OFF}$	$V_{DD}$ for Shutdown		2.4		2.65	V
$V_{DD\_ON}$	$V_{DD}$ for Startup		2.6		2.95	V
$T_{OT}$	Over Temperature Threshold			135		°C
$T_{HYS}$	Over Temperature Hysteresis			20		°C
$I_{LEAK}$	Internal FET Leakage Current	$EN = 0$ , $L_X = 3.3V$ (low FET), $L_X = 0V$ (high FET)			10	$\mu A$
$I_{LMAX}$	Peak Current Limit		5			A
$R_{DSON}$	FET On Resistance	Wafer level test only		30	60	$m\Omega$
$R_{DSONTC}$	$R_{DSON}$ Tempco			0.2		$m\Omega/^\circ C$
$I_{STP}$	Auxiliary Supply Tracking Positive Input Pull Down Current	$V_{STP} = V_{IN}/2$	-4	2.5		$\mu A$
$I_{STN}$	Auxiliary Supply Tracking Negative Input Pull Up Current	$V_{STN} = V_{IN}/2$		2.5	4	$\mu A$
$V_{PGP}$	Positive Power Good Threshold	With respect to target output voltage	6		16	%
$V_{PGN}$	Negative Power Good Threshold	With respect to target output voltage	-16		-6	%
$V_{PG\_HI}$	Power Good Drive High	$I_{PG} = 1mA$	2.7			V
$V_{PG\_LO}$	Power Good Drive Low	$I_{PG} = -1mA$			0.5	V
$V_{OVP}$	Over Voltage Protection			10		%
$V_{FB}$	Output Initial Accuracy	$I_{LOAD} = 0A$	0.977	0.992	1.007	V
$V_{FB\_LINE}$	Output Line Regulation	$V_{IN} = 3.3V$ , $\Delta V_{IN} = 10\%$ , $I_{LOAD} = 0A$		0.5		%
$V_{FB\_LOAD}$	Output Load Regulation	$0.5A < I_{LOAD} < 4A$		0.5		%
$V_{FB\_TC}$	Output Temperature Stability	$-40^\circ C < T_A < 85^\circ C$ , $I_{LOAD} = 2A$		$\pm 1$		%
$I_{FB}$	Feedback Input Pull Up Current	$V_{FB} = 0V$		100	200	nA
$V_{EN\_HI}$	EN Input High Level				2.7	V
$V_{EN\_LO}$	EN Input Low Level		1			V
$I_{EN}$	Enable Pull Up Current	$V_{EN} = 0$	-4	-2.5		$\mu A$

**Closed-Loop AC Electrical Specifications**

$V_S = V_{IN} = 3.3V$ ,  $T_A = T_J = 25^\circ C$ ,  $C_{OSC} = 390pF$ , unless otherwise specified.

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNIT
F <sub>OSC</sub>	Oscillator Initial Accuracy		310	365	420	kHz
t <sub>SYNC</sub>	Minimum Oscillator Sync Width			25		ns
M <sub>SS</sub>	Soft Start Slope			0.5		V/ms
t <sub>BRM</sub>	FET Break Before Make Delay			15		ns

**Typical Application Diagrams (Continued)**

**Pin Descriptions**

20-PIN SO (0.300")	28-PIN HTSSOP	PIN NAME	PIN FUNCTION
1	1	VREF	Bandgap reference bypass capacitor; typically 0.1µF to SGND
2	2	SGND	Control circuit negative supply or signal ground
3	3	COSC	Oscillator timing capacitor (see performance curves)
4	4	VDD	Control circuit positive supply; normally connected to VIN through an RC filter
5	5	VTJ	Junction temperature monitor; connected with 2.2nF to 3.3nF to SGND
6, 7	6, 7, 8, 9	PGND	Ground return of the regulator; connected to the source of the low-side synchronous NMOS power FET
8	10, 11	VIN	Power supply input of the regulator; connected to the drain of the high-side NMOS power FET
9	13	STP	Auxiliary supply tracking positive input; tied to regulator output to synchronize start up with a second supply; leave open for stand alone operation; 2µA internal pull down current
10	14	STN	Auxiliary supply tracking negative input; connect to output of a second supply to synchronize start up; leave open for stand alone operation; 2µA internal pull up current
11, 12, 13	15, 16	PGND	Ground return of the regulator; connected to the source of the low-side synchronous NMOS power FET
14, 15	18, 19, 20, 21, 22, 23	LX	Inductor drive pin; high current output whose average voltage equals the regulator output voltage
16	24	VHI	Positive supply of high-side driver; boot strapped from VDRV to LX with an external 0.22µF capacitor
17	25	VDRV	Positive supply of low-side driver and input voltage for high side boot strap
18	26	PG	Power good window comparator output; logic 1 when regulator output is within ±10% of target output voltage
19	27	FB	Voltage feedback input; connected to external resistor divider between VOUT and SGND; a 125nA pull-up current forces VOUT to SGND in the event that FB is floating
20	28	EN	Chip enable, active high; a 2µA internal pull up current enables the device if the pin is left open; a capacitor can be added at this pin to delay the start of converter

## Applications Information

### Circuit Description

#### General

The EL7563 is a fixed frequency, current mode controlled DC/DC converter with integrated N-channel power MOSFETs and a high precision reference. The device incorporates all the active circuitry required to implement a cost effective, user-programmable 4A synchronous step-down regulator suitable for use in DSP core power supplies. By combining fused-lead packaging technology with an efficient synchronous switching architecture, high power output (10W) can be realized without the use of discrete external heat sinks.

#### PWM Controller

The EL7563 regulates output voltage through the use of current-mode controlled pulse width modulation. The three main elements in a PWM controller are the feedback loop and reference, a pulse width modulator whose duty cycle is controlled by the feedback error signal, and a filter which averages the logic level modulator output. In a step-down (buck) converter, the feedback loop forces the time-averaged output of the modulator to equal the desired output voltage. Unlike pure voltage-mode control systems, current-mode control utilizes dual feedback loops to provide both output voltage and inductor current information to the controller. The voltage loop minimizes DC and transient errors in the output voltage by adjusting the PWM duty-cycle in response to changes in line or load conditions. Since the output voltage is equal to the time-averaged of the modulator output, the relatively large LC time constant found in power supply applications generally results in low bandwidth and poor transient response. By directly monitoring changes in inductor current via a series sense resistor the controller's response time is not entirely limited by the output LC filter and can react more quickly to changes in line and load conditions. This feed-forward characteristic also simplifies AC loop compensation since it adds a zero to the overall loop response. Through proper selection of the current-feedback to voltage-feedback ratio the overall loop response will approach a one-pole system. The resulting system offers several advantages over traditional voltage control systems, including simpler loop compensation, pulse by pulse current limiting, rapid response to line variation and good load step response.

The heart of the controller is an input direct summing comparator which sum voltage feedback, current feedback, slope compensation ramp and power tracking signals together. Slope compensation is required to prevent system instability that occurs in current-mode topologies operating at duty-cycles greater than 50% and is also used to define the open-loop gain of the overall system. The slope compensation is fixed internally and optimized for 500mA inductor ripple current. The power tracking will not contribute any input to the comparator steady-state operation. Current

feedback is measured by the patented sensing scheme that senses the inductor current flowing through the high-side switch whenever it is conducting. At the beginning of each oscillator period the high-side NMOS switch is turned on. The comparator inputs are gated off for a minimum period of time of about 150ns (LEB) after the high-side switch is turned on to allow the system to settle. The Leading Edge Blanking (LEB) period prevents the detection of erroneous voltages at the comparator inputs due to switching noise. If the inductor current exceeds the maximum current limit ( $I_{LMAX}$ ) a secondary over-current comparator will terminate the high-side switch on time. If  $I_{LMAX}$  has not been reached, the feedback voltage FB derived from the regulator output voltage  $V_{OUT}$  is then compared to the internal feedback reference voltage. The resultant error voltage is summed with the current feedback and slope compensation ramp. The high-side switch remains on until all four comparator inputs have summed to zero, at which time the high-side switch is turned off and the low-side switch is turned on. However, the maximum on-duty ratio of the high-side switch is limited to 95%. In order to eliminate cross-conduction of the high-side and low-side switches a 15ns break-before-make delay is incorporated in the switch drive circuitry. The output enable (EN) input allows the regulator output to be disabled by an external logic control signal.

#### Output Voltage Setting

In general:

$$V_{OUT} = 0.992V \times \left( 1 + \frac{R_2}{R_1} \right)$$

However, due to the relatively low open loop gain of the system, gain errors will occur as the output voltage and loop-gain is changed. This is shown in the performance curves. A 100nA pull-up current from FB to  $V_{DD}$  forces  $V_{OUT}$  to GND in the event that FB is floating.

#### NMOS Power FETs and Drive Circuitry

The EL7563 integrates low on-resistance (30m $\Omega$ ) NMOS FETs to achieve high efficiency at 4A. In order to use an NMOS switch for the high-side drive it is necessary to drive the gate voltage above the source voltage ( $L_X$ ). This is accomplished by bootstrapping the  $V_{HI}$  pin above the  $L_X$  voltage with an external capacitor  $CV_{HI}$  and internal switch and diode. When the low-side switch is turned on and the  $L_X$  voltage is close to GND potential, capacitor  $CV_{HI}$  is charged through internal switch to  $V_{DRV}$ , typically 6V with external charge-pump. At the beginning of the next cycle the high-side switch turns on and the  $L_X$  pins begin to rise from GND to  $V_{IN}$  potential. As the  $L_X$  pin rises the positive plate of capacitor  $CV_{HI}$  follows and eventually reaches a value of  $V_{DRV}+V_{IN}$ , typically 9V, for  $V_{IN}=3.3V$ . This voltage is then level shifted and used to drive the gate of the high-side FET, via the  $V_{HI}$  pin. A value of 0.22 $\mu F$  for  $CV_{HI}$  is recommended.

**Reference**

A 1.5% temperature compensated bandgap reference is integrated in the EL7563. The external  $V_{REF}$  capacitor acts as the dominant pole of the amplifier and can be increased in size to maximize transient noise rejection. A value of  $0.1\mu F$  is recommended.

**Oscillator**

The system clock is generated by an internal relaxation oscillator with a maximum duty-cycle of approximately 95%. Operating frequency can be adjusted through the  $C_{OSC}$  pin or can be driven by an external source. If the oscillator is driven by an external source care must be taken in selecting the ramp amplitude. Since  $C_{SLOPE}$  value is derived from the  $C_{OSC}$  ramp, changes to  $C_{OSC}$  ramp will change the  $C_{SLOPE}$  compensation ramp which determine the open-loop gain of the system.

When external synchronization is required, always choose  $C_{OSC}$  such that the free-running frequency is at least 20% lower than that of sync source to accommodate component and temperature variations. Figure 22 shows a typical connection.

FIGURE 22. OSCILLATOR SYNCHRONIZATION

**Junction Temperature Sensor**

An internal temperature sensor continuously monitors die temperature. In the event that die temperature exceeds the thermal trip-point, the system is in fault state and will be shut down. The upper and low trip-points are set to  $135^{\circ}C$  and  $115^{\circ}C$  respectively.

The VTJ pin is an accurate indication of the internal silicon junction temperature (see performance curve.) The junction temperature  $T_J$  ( $^{\circ}C$ ) can be deduced from the following relation:

$$T_J = 75 + \frac{1.2 - VTJ}{0.00384}$$

Where VTJ is the voltage at VTJ pin in volts.

**Power Good and Power On Reset**

During power up the output regulator will be disabled until  $V_{IN}$  reaches a value of approximately 2.9V. About 300mV hysteresis is present to eliminate noise-induced oscillations.

Under-voltage and over-voltage conditions on the regulator output are detected through an internal window comparator. A logic high on the PG output indicates that the regulated output voltage is within about +10% of the nominal selected output voltage.

**Power Tracking**

The power tracking pins STP and STN are the inputs to a comparator, whose HI output forces the PWM controller to skip switching cycle.

**1. Linear Tracking**

In this application, it is always the case that the lower voltage supply  $V_C$  tracks the higher output supply  $V_P$ . See Figure 23.

FIGURE 23. LINEAR POWER TRACKING

**2. Offset Tracking**

The intended start-up sequence is shown in Figure 24. In this configuration,  $V_C$  will not start until  $V_P$  reaches a preset value of:

$$\frac{R_B}{R_A + R_B} \times V_{IN}$$

FIGURE 24. OFFSET POWER TRACKING

The second way of offset tracking is to use the EN and Power Good pins, as shown in Figure 25. In this configuration,  $V_P$  does not have to be larger than  $V_C$ .

### 3. External Soft Start

An external soft start can be combined with auxiliary supply tracking to provide desired soft start other than internally preset soft start (Figure 26). The appropriate start-up time is:

$$t_s = R \times C \times \frac{V_O}{V_{IN}}$$

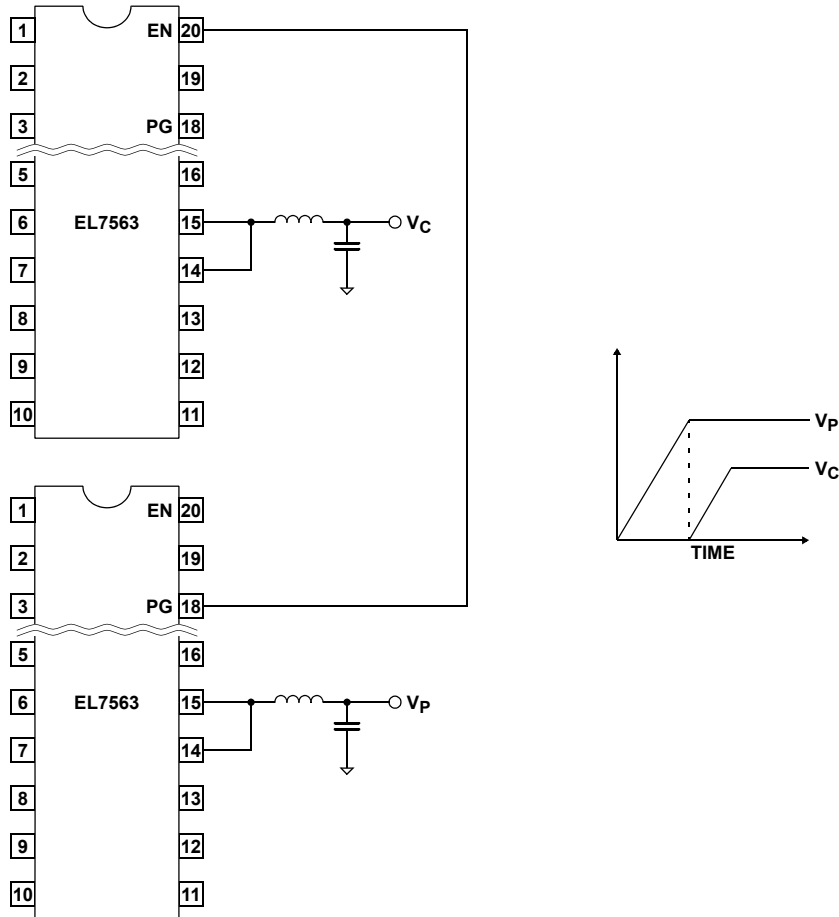

FIGURE 25. OFFSET TRACKING

FIGURE 26. EXTERNAL SOFT START

**Start-up Delay**

A capacitor can be added to the EN pin to delay the converter start-up (Figure 27) by utilizing the pull-up current. The delay time is approximately:

$$t_d(\text{ms}) = 1200 \times C(\mu\text{F})$$

**Thermal Management**

The EL7563CM utilizes “fused lead” packaging technology in conjunction with the system board layout to achieve a lower thermal resistance than typically found in standard SO20 packages. By fusing (or connecting) multiple external leads to the die substrate within the package, a very conductive heat path is created to the outside of the package. This conductive heat path MUST then be connected to a heat sinking area on the PCB in order to dissipate heat out and away from the device. The conductive paths for the SO20 package are the fused leads: # 6, 7, 11, 12, and 13. If a sufficient amount of PCB metal area is connected to the fused package leads, a junction-to-ambient resistance of 43°C/W can be achieved (compared to 85°C/W for a standard SO20 package). The general relationship between PCB heat-sinking metal area and the thermal resistance for this package is shown in the Performance Curves section of this data sheet. It can be readily seen that the thermal resistance for this package approaches an asymptotic value of approximately 43°C/W without any airflow, and 33°C/W with 100 LFPM airflow. Additional information can be found in Application Note #8 (Measuring the Thermal Resistance of Power Surface-Mount Packages). For a thermal shutdown die junction temperature of 135°C, and power dissipation of 1.5W, the ambient temperature can be as high as 70°C without airflow. With 100 LFPM airflow, the ambient temperature can be extended to 85°C.

The EL7563CRE utilizes the 28-pin HTSSOP package. The majority of heat is dissipated through the heat pad exposed at the bottom of the package. Therefore, the heat pad needs to be soldered to the PCB. The thermal resistance for this package is as low as 29°C/W, better than that of the SO20. Typical performance is shown in the curve section. The actual junction temperature can be measured at VTJ pin.

Since the thermal performance of the IC is heavily dependent on the board layout, the system designer should exercise care during the design phase to ensure that the IC will operate under the worst-case environmental conditions.

**Layout Considerations**

The layout is very important for the converter to function properly. Power Ground ( ↓ ) and Signal Ground ( ⊥ ) should be separated to ensure that the high pulse current in the Power Ground never interferes with the sensitive signals connected to Signal Ground. They should only be connected at one point (normally at the negative side of either the input or output capacitor.)

The trace connected to the FB pin is the most sensitive trace. It needs to be as short as possible and in a “quiet” place, preferably between PGND or SGND traces.

In addition, the bypass capacitor connected to the V<sub>DD</sub> pin needs to be as close to the pin as possible.

The heat of the chip is mainly dissipated through the PGND pins and through the heat pad at the bottom of the CRE package. Maximizing the copper area around these pins is preferable. In addition, a solid ground plane is always helpful for the EMI performance.

The demo board is a good example of layout based on these principles. Please refer to the EL7563 Application Brief for the layout.
