

# 18-Mbit (512K × 36/1M × 18) Pipelined SRAM with NoBL™ Architecture

## Features

- Pin-compatible and functionally equivalent to ZBT™
- Supports 200 MHz bus operations with zero wait states
  - Available speed grades are 200, and 167 MHz
- Internally self-timed output buffer control to eliminate the need to use asynchronous OE
- Fully registered (inputs and outputs) for pipelined operation
- Byte Write capability
- Single 2.5 V core power supply ( $V_{DD}$ )
- 2.5 V I/O power supply ( $V_{DDQ}$ )
- Fast clock-to-output times
  - 3.0 ns (for 200 MHz device)
- Clock Enable ( $\overline{CEN}$ ) pin to suspend operation
- Synchronous self-timed writes
- CY7C1370SV25 available in JEDEC-standard Pb-free 100-pin TQFP and non-Pb-free 165-ball FBGA packages and CY7C1372SV25 available in JEDEC-standard Pb-free 100-pin TQFP
- IEEE 1149.1 JTAG-Compatible Boundary Scan
- Burst capability – linear or interleaved burst order
- “ZZ” Sleep Mode option and Stop Clock option

## Functional Description

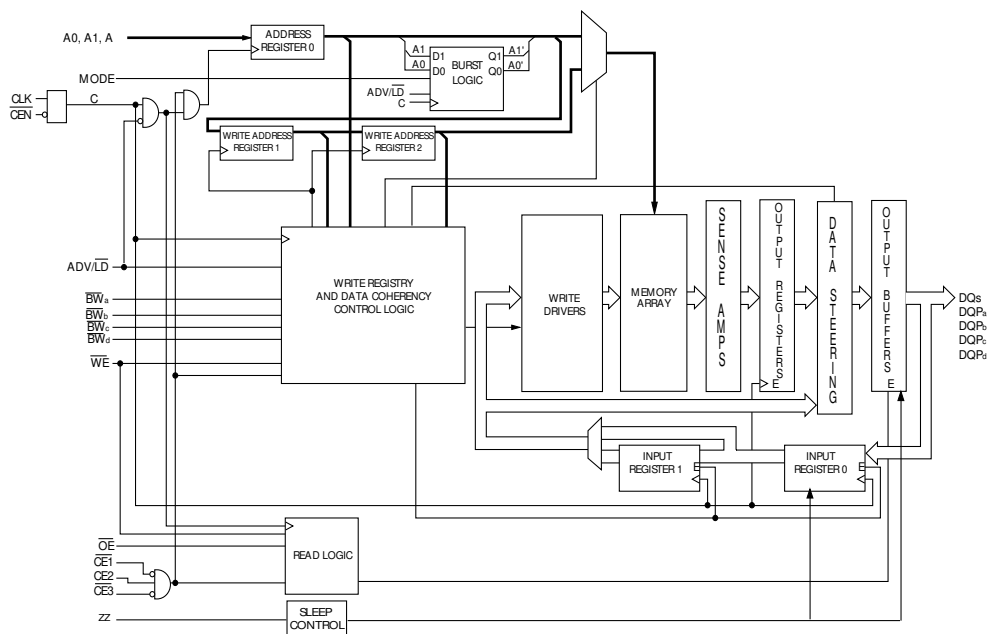

The CY7C1370SV25 and CY7C1372SV25 are 2.5 V, 512K × 36 and 1M × 18 Synchronous pipelined burst SRAMs with No Bus Latency™ (NoBL™) logic, respectively. They are designed to support unlimited true back-to-back Read/Write operations with no wait states. The CY7C1370SV25 and CY7C1372SV25 are equipped with the advanced (NoBL) logic required to enable consecutive Read/Write operations with data being transferred on every clock cycle. This feature dramatically improves the throughput of data in systems that require frequent Write/Read transitions. The CY7C1370SV25 and CY7C1372SV25 are pin-compatible and functionally equivalent to ZBT devices.

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. The clock input is qualified by the Clock Enable (CEN) signal, which when deasserted suspends operation and extends the previous clock cycle.

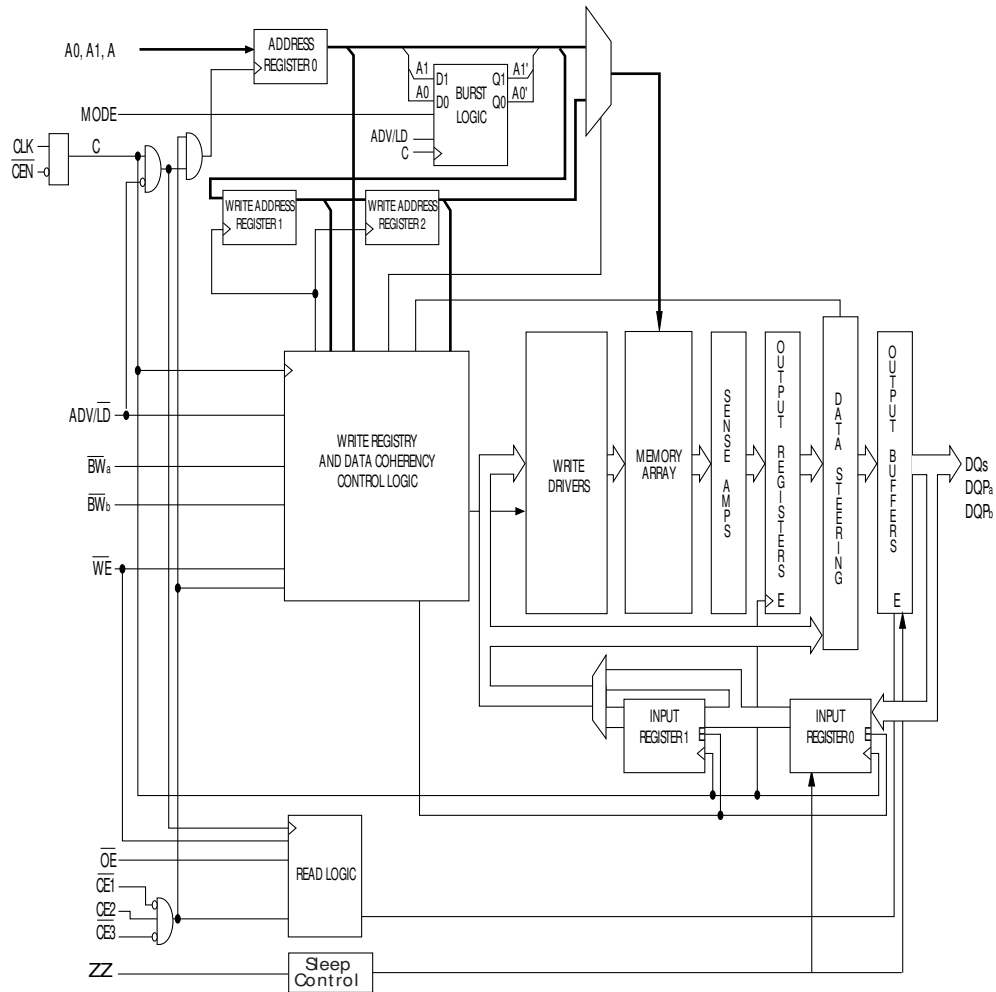

Write operations are controlled by the Byte Write Selects ( $BW_a$ – $BW_d$  for CY7C1370SV25 and  $BW_a$ – $BW_b$  for CY7C1372SV25) and a Write Enable ( $\overline{WE}$ ) input. All writes are conducted with on-chip synchronous self-timed write circuitry.

Three synchronous Chip Enables ( $\overline{CE}_1$ ,  $\overline{CE}_2$ ,  $\overline{CE}_3$ ) and an asynchronous Output Enable ( $\overline{OE}$ ) provide for easy bank selection and output three-state control. To avoid bus contention, the output drivers are synchronously three-stated during the data portion of a write sequence.

## Pin Definitions

| Pin Name   | I/O Type                       | Pin Description  |
|--|--------------------------------|--|
| A <sub>0</sub> , A <sub>1</sub> , A  | Input-Synchronous              | <b>Address Inputs Used to Select One of the Address Locations.</b> Sampled at the rising edge of the CLK.  |
| $\overline{BW}_a$ , $\overline{BW}_b$ ,<br>$\overline{BW}_c$ , $\overline{BW}_d$ | Input-Synchronous              | <b>Byte Write Select Inputs, Active LOW.</b> Qualified with $\overline{WE}$ to conduct writes to the SRAM. Sampled on the rising edge of CLK. $\overline{BW}_a$ controls DQ <sub>a</sub> and DQP <sub>a</sub> , $\overline{BW}_b$ controls DQ <sub>b</sub> and DQP <sub>b</sub> , $\overline{BW}_c$ controls DQ <sub>c</sub> and DQP <sub>c</sub> , $\overline{BW}_d$ controls DQ <sub>d</sub> and DQP <sub>d</sub> .  |
| $\overline{WE}$  | Input-Synchronous              | <b>Write Enable Input, Active LOW.</b> Sampled on the rising edge of CLK if $\overline{CEN}$ is active LOW. This signal must be asserted LOW to initiate a write sequence.   |
| ADV/LD   | Input-Synchronous              | <b>Advance/Load Input Used to Advance the On-Chip Address Counter or Load a New Address.</b> When HIGH (and $\overline{CEN}$ is asserted LOW) the internal burst counter is advanced. When LOW, a new address can be loaded into the device for an access. After being deselected, ADV/LD should be driven LOW to load a new address.  |
| CLK  | Input-Clock                    | <b>Clock Input.</b> Used to capture all synchronous inputs to the device. CLK is qualified with $\overline{CEN}$ . CLK is only recognized if $\overline{CEN}$ is active LOW.   |
| $\overline{CE}_1$  | Input-Synchronous              | <b>Chip Enable 1 Input, Active LOW.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_2$ and $\overline{CE}_3$ to select/deselect the device.   |
| $\overline{CE}_2$  | Input-Synchronous              | <b>Chip Enable 2 Input, Active HIGH.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_3$ to select/deselect the device.  |
| $\overline{CE}_3$  | Input-Synchronous              | <b>Chip Enable 3 Input, Active LOW.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_2$ to select/deselect the device.   |
| $\overline{OE}$  | Input-Asynchronous             | <b>Output Enable, Active LOW.</b> Combined with the synchronous logic block inside the device to control the direction of the I/O pins. When LOW, the I/O pins are allowed to behave as outputs. When deasserted HIGH, I/O pins are three-stated, and act as input data pins. $\overline{OE}$ is masked during the data portion of a write sequence, during the first clock when emerging from a deselected state and when the device has been deselected.   |
| CEN  | Input-Synchronous              | <b>Clock Enable Input, Active LOW.</b> When asserted LOW the clock signal is recognized by the SRAM. When deasserted HIGH the clock signal is masked. Since deasserting CEN does not deselect the device, $\overline{CEN}$ can be used to extend the previous cycle when required.   |
| DQ <sub>s</sub>  | I/O-Synchronous                | <b>Bidirectional Data I/O Lines.</b> As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by A <sub>[17:0]</sub> during the previous clock rise of the read cycle. The direction of the pins is controlled by $\overline{OE}$ and the internal control logic. When $\overline{OE}$ is asserted LOW, the pins can behave as outputs. When HIGH, DQ <sub>a</sub> –DQ <sub>d</sub> are placed in a three-state condition. The outputs are automatically three-stated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of $\overline{OE}$ . |
| DQP <sub>x</sub>   | I/O-Synchronous                | <b>Bidirectional Data Parity I/O Lines.</b> Functionally, these signals are identical to DQ <sub>s</sub> . During write sequences, DQP <sub>a</sub> is controlled by $\overline{BW}_a$ , DQP <sub>b</sub> is controlled by $\overline{BW}_b$ , DQP <sub>c</sub> is controlled by $\overline{BW}_c$ , and DQP <sub>d</sub> is controlled by $\overline{BW}_d$ .   |
| MODE   | Input Strap Pin                | <b>Mode Input.</b> Selects the burst order of the device. Tied HIGH selects the interleaved burst order. Pulled LOW selects the linear burst order. MODE should not change states during operation. When left floating MODE defaults to HIGH, to an interleaved burst order.   |
| TDO  | JTAG serial output Synchronous | <b>Serial Data Out to the JTAG Circuit.</b> Delivers data on the negative edge of TCK.   |
| TDI  | JTAG serial input Synchronous  | <b>Serial Data In to the JTAG Circuit.</b> Sampled on the rising edge of TCK.  |
| TMS  | Test Mode Select Synchronous   | <b>This Pin Controls the Test Access Port State Machine.</b> Sampled on the rising edge of TCK.  |

## Pin Definitions (continued)

| Pin Name                            | I/O Type           | Pin Description  |
|-------------------------------------|--------------------|--|
| TCK                                 | JTAG-Clock         | <b>Clock Input to the JTAG Circuitry.</b>  |
| V <sub>DD</sub>                     | Power Supply       | <b>Power Supply Inputs to the Core of the Device.</b>  |
| V <sub>DDQ</sub>                    | I/O Power Supply   | <b>Power Supply for the I/O Circuitry.</b>   |
| V <sub>SS</sub>                     | Ground             | <b>Ground for the Device.</b> Should be connected to ground of the system.   |
| NC                                  | –                  | <b>No Connects.</b> This pin is not connected to the die.  |
| NC/(36M, 72M, 144M, 288M, 576M, 1G) | –                  | <b>These Pins are Not Connected.</b> They are used for expansion to the 36M, 72M, 144M, 288M, 576M, and 1G densities.  |
| ZZ                                  | Input-Asynchronous | <b>ZZ “Sleep” Input.</b> This active HIGH input places the device in a non-time critical “sleep” condition with data integrity preserved. For normal operation, this pin must be LOW or left floating. ZZ pin has an internal pull down. |

## Functional Overview

The CY7C1370SV25 and CY7C1372SV25 are synchronous-pipelined Burst NoBL SRAMs designed specifically to eliminate wait states during Write/Read transitions. All synchronous inputs pass through input registers controlled by the rising edge of the clock. The clock signal is qualified with the Clock Enable input signal (CEN). If CEN is HIGH, the clock signal is not recognized and all internal states are maintained. All synchronous operations are qualified with CEN. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t<sub>CO</sub>) is 3.0 ns (200-MHz device).

Accesses can be initiated by asserting all three Chip Enables ( $\overline{CE}_1$ , CE<sub>2</sub>,  $\overline{CE}_3$ ) active at the rising edge of the clock. If Clock Enable (CEN) is active LOW and ADV/LD is asserted LOW, the address presented to the device is latched. The access can either be a read or write operation, depending on the status of the Write Enable (WE). BW<sub>X</sub> can be used to conduct byte write operations.

Write operations are qualified by the Write Enable ( $\overline{WE}$ ). All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous Chip Enables ( $\overline{CE}_1$ , CE<sub>2</sub>,  $\overline{CE}_3$ ) and an asynchronous Output Enable ( $\overline{OE}$ ) simplify depth expansion. All operations (Reads, Writes, and Deselects) are pipelined. ADV/LD should be driven LOW after the device has been deselected to load a new address for the next operation.

### Single Read Accesses

A read access is initiated when the following conditions are satisfied at clock rise: (1) CEN is asserted LOW, (2)  $\overline{CE}_1$ , CE<sub>2</sub>, and  $\overline{CE}_3$  are ALL asserted active, (3) the Write Enable input signal WE is deasserted HIGH, and (4) ADV/LD is asserted LOW. The address presented to the address inputs is latched into the Address Register and presented to the memory core and control logic. The control logic determines that a read access is in progress and allows the requested data to propagate to the input of the output register. At the rising edge of the next clock the requested data is allowed to propagate through the output

register and onto the data bus within 3.0 ns (200-MHz device) provided OE is active LOW. After the first clock of the read access the output buffers are controlled by  $\overline{OE}$  and the internal control logic.  $\overline{OE}$  must be driven LOW in order for the device to drive out the requested data. During the second clock, a subsequent operation (Read/Write/Deselect) can be initiated. Deselecting the device is also pipelined. Therefore, when the SRAM is deselected at clock rise by one of the chip enable signals, its output tri-states following the next clock rise.

### Burst Read Accesses

The CY7C1370SV25 and CY7C1372SV25 have an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four Reads without reasserting the address inputs. ADV/LD must be driven LOW to load a new address into the SRAM, as described in the [Single Read Accesses](#) section. The sequence of the burst counter is determined by the MODE input signal. A LOW input on MODE selects a linear burst mode, a HIGH selects an interleaved burst sequence. Both burst counters use A0 and A1 in the burst sequence, and wraps around when incremented sufficiently. A HIGH input on ADV/LD increments the internal burst counter regardless of the state of chip enables inputs or WE. WE is latched at the beginning of a burst cycle. Therefore, the type of access (Read or Write) is maintained throughout the burst sequence.

### Single Write Accesses

Write access are initiated when the following conditions are satisfied at clock rise: (1) CEN is asserted LOW, (2)  $\overline{CE}_1$ , CE<sub>2</sub>, and  $\overline{CE}_3$  are ALL asserted active, and (3) the write signal WE is asserted LOW. The address presented is loaded into the Address Register. The write signals are latched into the Control Logic block.

On the subsequent clock rise the data lines are automatically three-stated regardless of the state of the  $\overline{OE}$  input signal. This allows the external logic to present the data on DQ and DQP (DQ<sub>a,b,c,d</sub>/DQP<sub>a,b,c,d</sub> for CY7C1370SV25 and DQ<sub>a,b</sub>/DQP<sub>a,b</sub> for CY7C1372SV25). In addition, the address for the subsequent

access (Read/Write/Deselect) is latched into the Address Register (provided the appropriate control signals are asserted).

On the next clock rise the data presented to DQ and DQP ( $DQ_{a,b,c,d}/DQP_{a,b,c,d}$  for CY7C1370SV25 &  $DQ_{a,b}/DQP_{a,b}$  for CY7C1372SV25) (or a subset for byte write operations, see Write Cycle Description table for details) inputs is latched into the device and the write is complete.

The data written during the write operation is controlled by  $\overline{BW}$  ( $BW_{a,b,c,d}$  for CY7C1370SV25 and  $BW_{a,b}$  for CY7C1372SV25) signals. The CY7C1370SV25/CY7C1372SV25 provides byte write capability that is described in the Write Cycle Description table. Asserting the Write Enable input (WE) with the selected Byte Write Select (BW) input selectively writes to only the desired bytes. Bytes not selected during a byte write operation remains unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations. Byte write capability has been included to greatly simplify Read/Modify/Write sequences, which can be reduced to simple byte write operations.

Because the CY7C1370SV25 and CY7C1372SV25 are common I/O devices, data should not be driven into the device while the outputs are active. The Output Enable ( $\overline{OE}$ ) can be deasserted HIGH before presenting data to the DQ and DQP ( $DQ_{a,b,c,d}/DQP_{a,b,c,d}$  for CY7C1370SV25 and  $DQ_{a,b}/DQP_{a,b}$  for CY7C1372SV25) inputs. Doing so three-states the output drivers. As a safety precaution, DQ and DQP ( $DQ_{a,b,c,d}/DQP_{a,b,c,d}$  for CY7C1370SV25 and  $DQ_{a,b}/DQP_{a,b}$  for CY7C1372SV25) are automatically three-stated during the data portion of a write cycle, regardless of the state of  $\overline{OE}$ .

### Burst Write Accesses

The CY7C1370SV25/CY7C1372SV25 has an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four WRITE operations without reasserting the address inputs. ADV/LD must be driven LOW to load the initial address, as described in the Single Write Access section. When ADV/LD is driven HIGH on the subsequent clock rise, the chip enables ( $\overline{CE}_1$ ,  $\overline{CE}_2$ , and  $\overline{CE}_3$ ) and WE inputs are ignored and the burst counter is incremented. The correct BW ( $BW_{a,b,c,d}$  for

CY7C1370SV25 and  $\overline{BW}_{a,b}$  for CY7C1372SV25) inputs must be driven in each cycle of the burst write to write the correct bytes of data.

### Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation “sleep” mode. Two clock cycles are required to enter into or exit from this “sleep” mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the “sleep” mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the “sleep” mode.  $\overline{CE}_1$ ,  $\overline{CE}_2$ , and  $\overline{CE}_3$ , must remain inactive for the duration of  $t_{ZZREC}$  after the ZZ input returns LOW.

### Interleaved Burst Address Table

(MODE = Floating or  $V_{DD}$ )

| First Address<br>A1:A0 | Second Address<br>A1:A0 | Third Address<br>A1:A0 | Fourth Address<br>A1:A0 |
|------------------------|-------------------------|------------------------|-------------------------|
| 00                     | 01                      | 10                     | 11                      |
| 01                     | 00                      | 11                     | 10                      |
| 10                     | 11                      | 00                     | 01                      |
| 11                     | 10                      | 01                     | 00                      |

### Linear Burst Address Table

(MODE = GND)

| First Address<br>A1:A0 | Second Address<br>A1:A0 | Third Address<br>A1:A0 | Fourth Address<br>A1:A0 |
|------------------------|-------------------------|------------------------|-------------------------|
| 00                     | 01                      | 10                     | 11                      |
| 01                     | 10                      | 11                     | 00                      |
| 10                     | 11                      | 00                     | 01                      |
| 11                     | 00                      | 01                     | 10                      |

### ZZ Mode Electrical Characteristics

| Parameter   | Description                       | Test Conditions           | Min        | Max        | Unit |
|-------------|-----------------------------------|---------------------------|------------|------------|------|
| $I_{DDZZ}$  | Sleep mode standby current        | $ZZ \geq V_{DD} - 0.2 V$  | –          | 80         | mA   |
| $t_{ZZS}$   | Device operation to ZZ            | $ZZ \geq V_{DD} - 0.2 V$  | –          | $2t_{CYC}$ | ns   |
| $t_{ZZREC}$ | ZZ recovery time                  | $ZZ \leq 0.2 V$           | $2t_{CYC}$ | –          | ns   |
| $t_{ZZI}$   | ZZ active to sleep current        | This parameter is sampled | –          | $2t_{CYC}$ | ns   |
| $t_{RZZI}$  | ZZ Inactive to exit sleep current | This parameter is sampled | 0          | –          | ns   |

## Truth Table

The Truth Table for CY7C1370SV25 and CY7C1372SV25 are as follows. [1, 2, 3, 4, 5, 6, 7]

| Operation                     | Address Used | $\overline{CE}$ | ZZ | ADV/LD | $\overline{WE}$ | $\overline{BW}_x$ | $\overline{OE}$ | $\overline{CEN}$ | CLK | DQ           |
|-------------------------------|--------------|-----------------|----|--------|-----------------|-------------------|-----------------|------------------|-----|--------------|
| Deselect Cycle                | None         | H               | L  | L      | X               | X                 | X               | L                | L-H | Tri-state    |
| Continue Deselect Cycle       | None         | X               | L  | H      | X               | X                 | X               | L                | L-H | Tri-state    |

### Notes

1. X = "Don't Care", H = Logic HIGH, L = Logic LOW,  $\overline{CE}$  stands for ALL Chip Enables active.  $\overline{BW}_x = L$  signifies that at least one Byte Write Select is active,  $\overline{BW}_x = \text{Valid}$  signifies that the desired byte write selects are asserted, see [Truth Table](#) for details.
2. Write is defined by WE and  $\overline{BW}_x$ . See [Truth Table](#) for details.
3. When a write cycle is detected, all IOs are tri-stated, even during byte writes.
4. The DQ and DQP pins are controlled by the current cycle and the  $\overline{OE}$  signal.
5.  $\overline{CEN} = H$  inserts wait states.
6. Device powers up deselected and the IOs in a tri-state condition, regardless of  $\overline{OE}$ .
7.  $\overline{OE}$  is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle  $DQ_s$  and  $DQP_x = \text{Three-state}$  when  $\overline{OE}$  is inactive or when the device is deselected, and  $DQ_s = \text{data}$  when  $\overline{OE}$  is active.

## Partial Write Cycle Description

The Partial Write Cycle Description for CY7C1370SV25 and CY7C1372SV25 are as follows. [8, 9, 10, 11]

| Function (CY7C1370SV25)                                | $\overline{WE}$ | $\overline{BW}_d$ | $\overline{BW}_c$ | $\overline{BW}_b$ | $\overline{BW}_a$ |
|--|-----------------|-------------------|-------------------|-------------------|-------------------|
| Read   | H               | X                 | X                 | X                 | X                 |
| Write – No bytes written                               | L               | H                 | H                 | H                 | H                 |
| Write Byte a – (DQ <sub>a</sub> and DQP <sub>a</sub> ) | L               | H                 | H                 | H                 | L                 |
| Write Byte b – (DQ <sub>b</sub> and DQP <sub>b</sub> ) | L               | H                 | H                 | L                 | H                 |
| Write Bytes b, a                                       | L               | H                 | H                 | L                 | L                 |
| Write Byte c – (DQ <sub>c</sub> and DQP <sub>c</sub> ) | L               | H                 | L                 | H                 | H                 |
| Write Bytes c, a                                       | L               | H                 | L                 | H                 | L                 |
| Write Bytes c, b                                       | L               | H                 | L                 | L                 | H                 |
| Write Bytes c, b, a                                    | L               | H                 | L                 | L                 | L                 |
| Write Byte d – (DQ <sub>d</sub> and DQP <sub>d</sub> ) | L               | L                 | H                 | H                 | H                 |
| Write Bytes d, a                                       | L               | L                 | H                 | H                 | L                 |
| Write Bytes d, b                                       | L               | L                 | H                 | L                 | H                 |
| Write Bytes d, b, a                                    | L               | L                 | H                 | L                 | L                 |
| Write Bytes d, c                                       | L               | L                 | L                 | H                 | H                 |
| Write Bytes d, c, a                                    | L               | L                 | L                 | H                 | L                 |

### Notes

8. X = "Don't Care", H = Logic HIGH, L = Logic LOW,  $\overline{CE}$  stands for ALL Chip Enables active.  $\overline{BW}_x = L$  signifies at least one Byte Write Select is active,  $\overline{BW}_x = \text{Valid}$  signifies that the desired byte write selects are asserted, see [Truth Table on page 9](#) for details.
9. Write is defined by  $\overline{WE}$  and  $\overline{BW}_x$ . See [Truth Table on page 9](#) for details.
10. When a write cycle is detected, all IOs are tri-stated, even during byte writes.
11. Table only lists a partial listing of the byte write combinations. Any Combination of  $\overline{BW}_x$  is valid. Appropriate write is done based on which byte write is active.

## IEEE 1149.1 Serial Boundary Scan (JTAG)

The CY7C1370SV25 incorporates a serial boundary scan test access port (TAP). This part is fully compliant with 1149.1. The TAP operates using JEDEC-standard 3.3 V or 2.5 V I/O logic levels.

The CY7C1370SV25 contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

### Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW ( $V_{SS}$ ) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternately be connected to  $V_{DD}$  through a pull up resistor. TDO should be left unconnected. Upon power up, the device is up in a reset state which does not interfere with the operation of the device.

### Test Access Port (TAP)

#### Test Clock (TCK)

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

#### Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. It is allowable to leave this ball unconnected if the TAP is not used. The ball is pulled up internally, resulting in a logic HIGH level.

#### Test Data-In (TDI)

The TDI ball is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information on loading the instruction register, see [TAP Controller State Diagram on page 13](#). TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) of any register.

#### Test Data-Out (TDO)

The TDO output ball is used to serially clock data-out from the registers. The output is active depending upon the current state of the TAP state machine (see [Identification Codes on page 17](#)). The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register.

### Performing a TAP Reset

A RESET is performed by forcing TMS HIGH ( $V_{DD}$ ) for five rising edges of TCK. This RESET does not affect the operation of the SRAM and may be performed while the SRAM is operating.

At power up, the TAP is reset internally to ensure that TDO comes up in a High Z state.

### TAP Registers

Registers are connected between the TDI and TDO balls and scans data into and out of the SRAM test circuitry. Only one register can be selected at a time through the instruction register.

Data is serially loaded into the TDI ball on the rising edge of TCK. Data is output on the TDO ball on the falling edge of TCK.

#### Instruction Register

Three-bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO balls as shown in the [TAP Controller Block Diagram on page 14](#). Upon power up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary "01" pattern to allow for fault isolation of the board-level serial test data path.

#### Bypass Register

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single-bit register that can be placed between the TDI and TDO balls. This shifts data through the SRAM with minimal delay. The bypass register is set LOW ( $V_{SS}$ ) when the BYPASS instruction is executed.

#### Boundary Scan Register

The boundary scan register is connected to all the input and bidirectional balls on the SRAM.

The boundary scan register is loaded with the contents of the RAM I/O ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO balls when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD and SAMPLE Z instructions can be used to capture the contents of the I/O ring.

The [Boundary Scan Order on page 18](#) show the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI and the LSB is connected to TDO.

#### Identification (ID) Register

The ID register is loaded with a vendor-specific, 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in the [Identification Register Definitions on page 17](#).

### TAP Instruction Set

#### Overview

Eight different instructions are possible with the three bit instruction register. All combinations are listed in the [Identification Codes on page 17](#). Three of these instructions are listed as RESERVED and should not be used. The other five instructions are described in this section in detail.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute the instruction after it is shifted in, the TAP controller is moved into the Update-IR state.

### EXTEST

The EXTEST instruction drives the preloaded data out through the system output pins. This instruction also connects the boundary scan register for serial access between the TDI and TDO in the shift-DR controller state.

### IDCODE

The IDCODE instruction loads a vendor-specific, 32-bit code into the instruction register. It also places the instruction register between the TDI and TDO balls and shifts the IDCODE out of the device when the TAP controller enters the Shift-DR state.

The IDCODE instruction is loaded into the instruction register upon power up or whenever the TAP controller is given a test logic reset state.

### SAMPLE Z

The SAMPLE Z instruction connects the boundary scan register between the TDI and TDO balls when the TAP controller is in a Shift-DR state. It also places all SRAM outputs into a High Z state.

### SAMPLE/PRELOAD

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. When the SAMPLE/PRELOAD instructions are loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the inputs and output pins is captured in the boundary scan register.

The user must be aware that the TAP controller clock can only operate at a frequency up to 20 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output undergoes a transition. The TAP may then try to capture a signal while in transition (metastable state). This does not harm the device, but there is no guarantee as to the value that is captured. Repeatable results may not be possible.

To guarantee that the boundary scan register captures the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture setup plus hold times ( $t_{CS}$  and  $t_{CH}$ ). The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is

still possible to capture all other signals and simply ignore the value of the CK and CK captured in the boundary scan register.

After the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO pins.

PRELOAD places an initial data pattern at the latched parallel outputs of the boundary scan register cells prior to the selection of another boundary scan test operation.

The shifting of data for the SAMPLE and PRELOAD phases can occur concurrently when required – that is, while data captured is shifted out, the preloaded data can be shifted in.

### BYPASS

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO balls. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

### EXTEST Output Bus Tri-State

IEEE Standard 1149.1 mandates that the TAP controller be able to put the output bus into a tri-state mode.

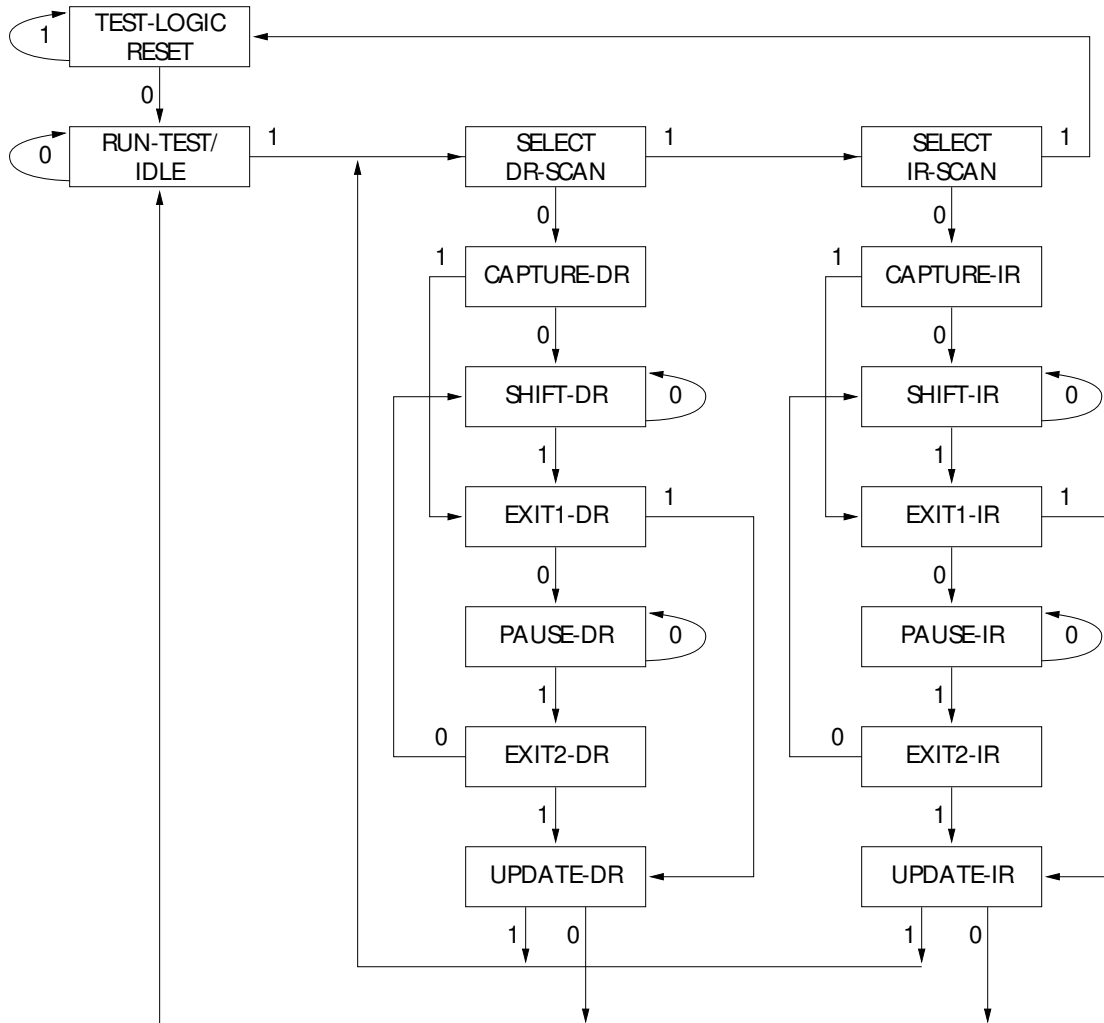

The boundary scan register has a special bit located at bit #89 (for 165-ball FBGA package). When this scan cell, called the “extest output bus tri-state,” is latched into the preload register during the “Update-DR” state in the TAP controller, it directly controls the state of the output (Q-bus) pins, when the EXTEST is entered as the current instruction. When HIGH, it enables the output buffers to drive the output bus. When LOW, this bit places the output bus into a High Z condition.

This bit can be set by entering the SAMPLE/PRELOAD or EXTEST command, and then shifting the desired bit into that cell, during the “Shift-DR” state. During “Update-DR,” the value loaded into that shift-register cell latches into the preload register. When the EXTEST instruction is entered, this bit directly controls the output Q-bus pins. Note that this bit is preset HIGH to enable the output when the device is powered-up, and also when the TAP controller is in the “Test-Logic-Reset” state.

### Reserved

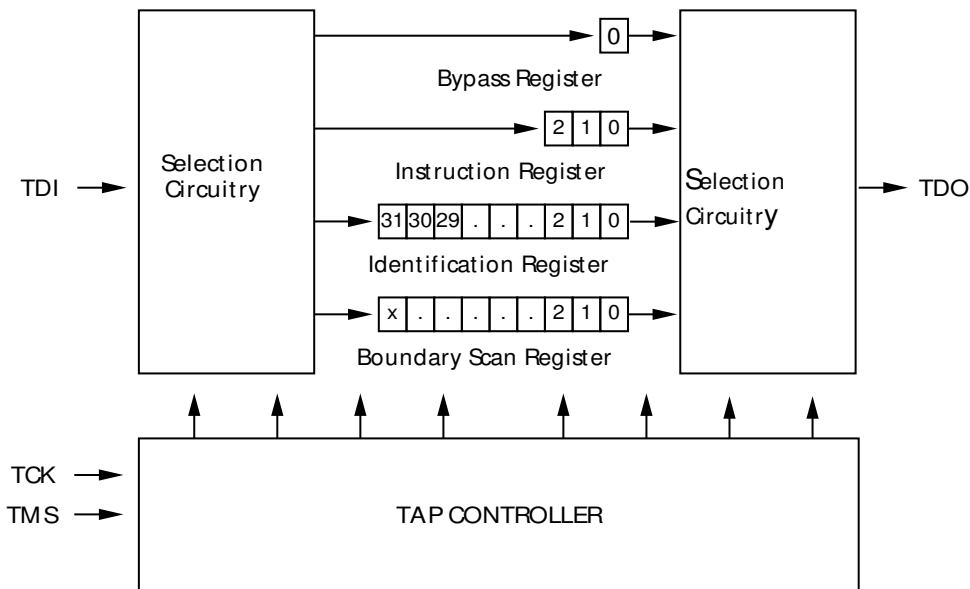

These instructions are not implemented but are reserved for future use. Do not use these instructions.

### TAP Controller State Diagram

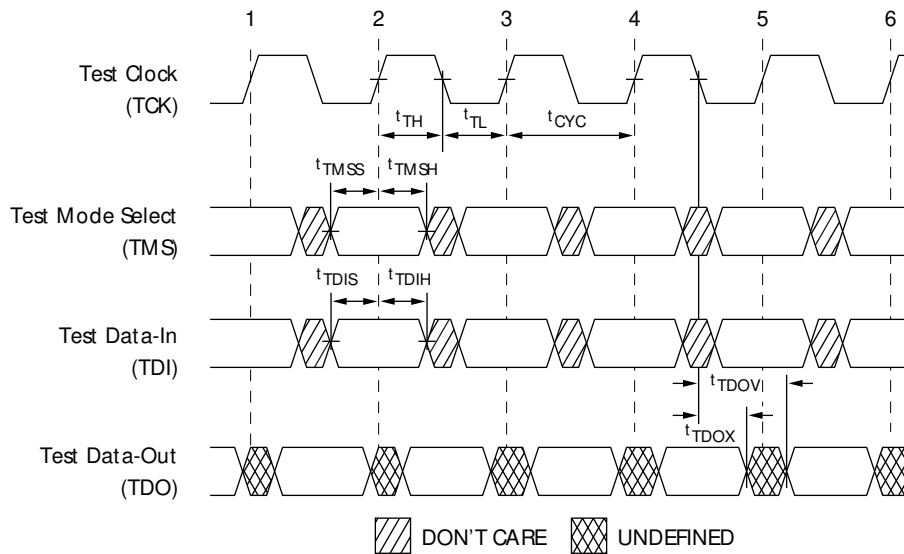

The 0/1 next to each state represents the value of TMS at the rising edge of TCK.

## TAP AC Switching Characteristics

Over the Operating Range

| Parameter <sup>[12, 13]</sup> | Description                   | Min | Max | Unit |
|-------------------------------|-------------------------------|-----|-----|------|
| <b>Clock</b>                  |                               |     |     |      |
| $t_{TCYC}$                    | TCK Clock Cycle Time          | 50  | –   | ns   |
| $t_{TF}$                      | TCK Clock Frequency           | –   | 20  | MHz  |
| $t_{TH}$                      | TCK Clock HIGH time           | 20  | –   | ns   |
| $t_{TL}$                      | TCK Clock LOW time            | 20  | –   | ns   |
| <b>Output Times</b>           |                               |     |     |      |
| $t_{TDOV}$                    | TCK Clock LOW to TDO Valid    | –   | 10  | ns   |
| $t_{TDOX}$                    | TCK Clock LOW to TDO Invalid  | 0   | –   | ns   |
| <b>Setup Times</b>            |                               |     |     |      |
| $t_{TMSS}$                    | TMS Setup to TCK Clock Rise   | 5   | –   | ns   |
| $t_{TDIS}$                    | TDI Setup to TCK Clock Rise   | 5   | –   | ns   |
| $t_{CS}$                      | Capture Setup to TCK Rise     | 5   | –   | ns   |
| <b>Hold Times</b>             |                               |     |     |      |
| $t_{TMSH}$                    | TMS Hold after TCK Clock Rise | 5   | –   | ns   |
| $t_{TDIH}$                    | TDI Hold after Clock Rise     | 5   | –   | ns   |
| $t_{CH}$                      | Capture Hold after Clock Rise | 5   | –   | ns   |

### Notes

12.  $t_{CS}$  and  $t_{CH}$  refer to the setup and hold time requirements of latching data from the boundary scan register.

13. Test conditions are specified using the load in TAP AC test Conditions.  $t_R/t_F = 1$  ns.

**2.5 V TAP AC Test Conditions**

Input pulse levels .....  $V_{SS}$  to 2.5 V  
 Input rise and fall time ..... 1 ns  
 Input timing reference levels ..... 1.25 V  
 Output reference levels ..... 1.25 V  
 Test load termination supply voltage ..... 1.25 V

**2.5 V TAP AC Output Load Equivalent**

**TAP DC Electrical Characteristics and Operating Conditions**

## Scan Register Sizes

| Register Name                               | Bit Size (× 18) |
|---|-----------------|
| Instruction                                 | 3               |
| Bypass                                      | 1               |
| ID  | 32              |
| Boundary Scan Order (165-ball FBGA package) | 89              |

## Identification Register Definitions

| Instruction Field         | CY7C1370SV25      | Description                                  |
|---------------------------|-------------------|--|
| Revision Number (31:29)   | 000               | Reserved for version number.                 |
| Cypress Device ID (28:12) | 01011001000100101 | Reserved for future use.                     |
| Cypress JEDEC ID (11:1)   | 00000110100       | Allows unique identification of SRAM vendor. |
| ID Register Presence (0)  | 1                 | Indicate the presence of an ID register.     |

## Identification Codes

| Instruction    | Code | Description  |
|----------------|------|--|
| EXTEST         | 000  | Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM outputs to High Z state.                |
| IDCODE         | 001  | Loads the ID register with the vendor ID code and places the register between TDI and TDO. This operation does not affect SRAM operations. |
| SAMPLE Z       | 010  | Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM output drivers to a High Z state.       |
| RESERVED       | 011  | Do Not Use: This instruction is reserved for future use.   |
| SAMPLE/PRELOAD | 100  | Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Does not affect SRAM operation.                         |
| RESERVED       | 101  | Do Not Use: This instruction is reserved for future use.   |
| RESERVED       | 110  | Do Not Use: This instruction is reserved for future use.   |
| BYPASS         | 111  | Places the bypass register between TDI and TDO. This operation does not affect SRAM operations.  |

**Notes**

- 15. Balls which are NC (No Connect) are pre-set LOW.
- 16. Bit# 89 is pre-set HIGH.

## Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Storage Temperature ..... -65 °C to +150 °C  
 Ambient Temperature with  
 Power Applied ..... -55 °C to +125 °C  
 Supply Voltage on V<sub>DD</sub> relative to GND ..... -0.5 V to +3.6 V  
 Supply Voltage on V<sub>DDQ</sub> relative to GND ..... -0.5 V to +V<sub>DD</sub>  
 DC to Outputs in Tri-State ..... -0.5 V to V<sub>DDQ</sub> + 0.5 V

DC Input Voltage ..... -0.5 V to V<sub>DD</sub> + 0.5 V  
 Current into Outputs (LOW) ..... 20 mA  
 Static Discharge Voltage  
 (per MIL-STD-883, Method 3015) ..... > 2001 V  
 Latch-up Current ..... > 200 mA

## Operating Range

| Range      | Ambient Temperature | V <sub>DD</sub> /V <sub>DDQ</sub> |
|------------|---------------------|-----------------------------------|
| Commercial | 0 °C to +70 °C      | 2.5 V ± 5%                        |

### Notes

17. Overshoot: V<sub>IH(AC)</sub> < V<sub>DD</sub> + 1.5 V (Pulse width less than t<sub>CYC</sub>/2), undershoot: V<sub>IL(AC)</sub> > -2 V (Pulse width less than t<sub>CYC</sub>/2).
18. T<sub>Power up</sub>: Assumes a linear ramp from 0 V to V<sub>DD</sub> (min) within 200 ms. During this time V<sub>IH</sub> < V<sub>DD</sub> and V<sub>DDQ</sub> ≤ V<sub>DD</sub>.
19. Tested initially and after any design or process change that may affect these parameters.
20. The operation current is calculated with 50% read cycle and 50% write cycle.

## Capacitance

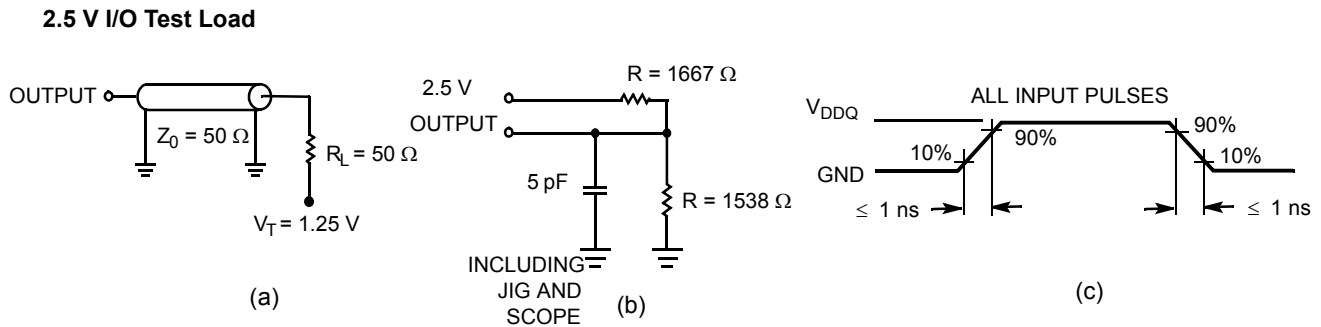

| Parameter <sup>[21]</sup> | Description              | Test Conditions   | 100-pin TQFP Package | 165-ball FBGA Package | Unit |
|---------------------------|--------------------------|---|----------------------|-----------------------|------|
| C <sub>IN</sub>           | Input capacitance        | T <sub>A</sub> = 25 °C, f = 1 MHz,<br>V <sub>DD</sub> = 2.5 V, V <sub>DDQ</sub> = 2.5 V | 5                    | 9                     | pF   |
| C <sub>CLK</sub>          | Clock input capacitance  |   | 5                    | 9                     | pF   |
| C <sub>IO</sub>           | Input/Output capacitance |   | 5                    | 9                     | pF   |

## Thermal Resistance

| Parameter <sup>[21]</sup> | Description                              | Test Conditions  | 100-pin TQFP Package | 165-ball FBGA Package | Unit |
|---------------------------|--|--|----------------------|-----------------------|------|
| Θ <sub>JA</sub>           | Thermal resistance (junction to ambient) | Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA/JESD51. | 28.66                | 20.7                  | °C/W |
| Θ <sub>JC</sub>           | Thermal resistance (junction to case)    |  | 4.08                 | 4.0                   | °C/W |

## AC Test Loads and Waveforms

Figure 4. AC Test Loads and Waveforms

**Note**

21. Tested initially and after any design or process change that may affect these parameters.

## Switching Characteristics

Over the Operating Range

| Parameter [22, 23]  | Description  | -200 |     | -167 |     | Unit |
|---------------------|--|------|-----|------|-----|------|
|                     |  | Min  | Max | Min  | Max |      |
| $t_{Power}^{[24]}$  | $V_{CC}(\text{typical})$ to the first access read or write | 1    | –   | 1    | –   | ms   |
| <b>Clock</b>        |  |      |     |      |     |      |
| $t_{CYC}$           | Clock Cycle Time   | 5    | –   | 6    | –   | ns   |
| $F_{MAX}$           | Maximum Operating Frequency                                | –    | 200 | –    | 167 | MHz  |
| $t_{CH}$            | Clock HIGH   | 2.0  | –   | 2.2  | –   | ns   |
| $t_{CL}$            | Clock LOW  | 2.0  | –   | 2.2  | –   | ns   |
| <b>Output Times</b> |  |      |     |      |     |      |
| $t_{CO}$            | Data Output Valid After CLK Rise                           | –    | 3.0 | –    | 3.4 | ns   |
| $t_{EOV}$           | $\overline{OE}$ LOW to Output Valid                        | –    | 3.0 | –    | 3.4 | ns   |
| $t_{DOH}$           | Data Output Hold After CLK Rise                            | 1.3  | –   | 1.3  | –   | ns   |
| $t_{CHZ}$           | Clock to High Z [25, 26, 27]                               | –    | 3.0 | –    | 3.4 | ns   |
| $t_{CLZ}$           | Clock to Low Z [25, 26, 27]                                | 1.3  | –   | 1.3  | –   | ns   |
| $t_{EOHZ}$          | $\overline{OE}$ HIGH to Output High Z [25, 26, 27]         | –    | 3.0 | –    | 3.4 | ns   |
| $t_{EOLZ}$          | $\overline{OE}$ LOW to Output Low Z [25, 26, 27]           | 0    | –   | 0    | –   | ns   |
| <b>Setup Times</b>  |  |      |     |      |     |      |
| $t_{AS}$            | Address Setup Before CLK Rise                              | 1.4  | –   | 1.5  | –   | ns   |
| $t_{DS}$            | Data Input Setup Before CLK Rise                           | 1.4  | –   | 1.5  | –   | ns   |
| $t_{CENS}$          | $\overline{CEN}$ Setup Before CLK Rise                     | 1.4  | –   | 1.5  | –   | ns   |
| $t_{WES}$           | $\overline{WE}$ , $\overline{BW}_x$ Setup Before CLK Rise  | 1.4  | –   | 1.5  | –   | ns   |
| $t_{ALS}$           | $\overline{ADV/LD}$ Setup Before CLK Rise                  | 1.4  | –   | 1.5  | –   | ns   |
| $t_{CES}$           | Chip Select Setup  | 1.4  | –   | 1.5  | –   | ns   |
| <b>Hold Times</b>   |  |      |     |      |     |      |
| $t_{AH}$            | Address Hold After CLK Rise                                | 0.4  | –   | 0.5  | –   | ns   |
| $t_{DH}$            | Data Input Hold After CLK Rise                             | 0.4  | –   | 0.5  | –   | ns   |
| $t_{CENH}$          | $\overline{CEN}$ Hold After CLK Rise                       | 0.4  | –   | 0.5  | –   | ns   |
| $t_{WEH}$           | $\overline{WE}$ , $\overline{BW}_x$ Hold After CLK Rise    | 0.4  | –   | 0.5  | –   | ns   |
| $t_{ALH}$           | $\overline{ADV/LD}$ Hold after CLK Rise                    | 0.4  | –   | 0.5  | –   | ns   |
| $t_{CEH}$           | Chip Select Hold After CLK Rise                            | 0.4  | –   | 0.5  | –   | ns   |

### Notes

22. Timing reference 1.25 V when  $V_{DDQ} = 2.5$  V.

23. Test conditions shown in (a) of Figure 4 on page 20 unless otherwise noted.

24. This part has a voltage regulator internally;  $t_{Power}$  is the time power is supplied above  $V_{DD(\text{minimum})}$  initially, before a Read or Write operation can be initiated.

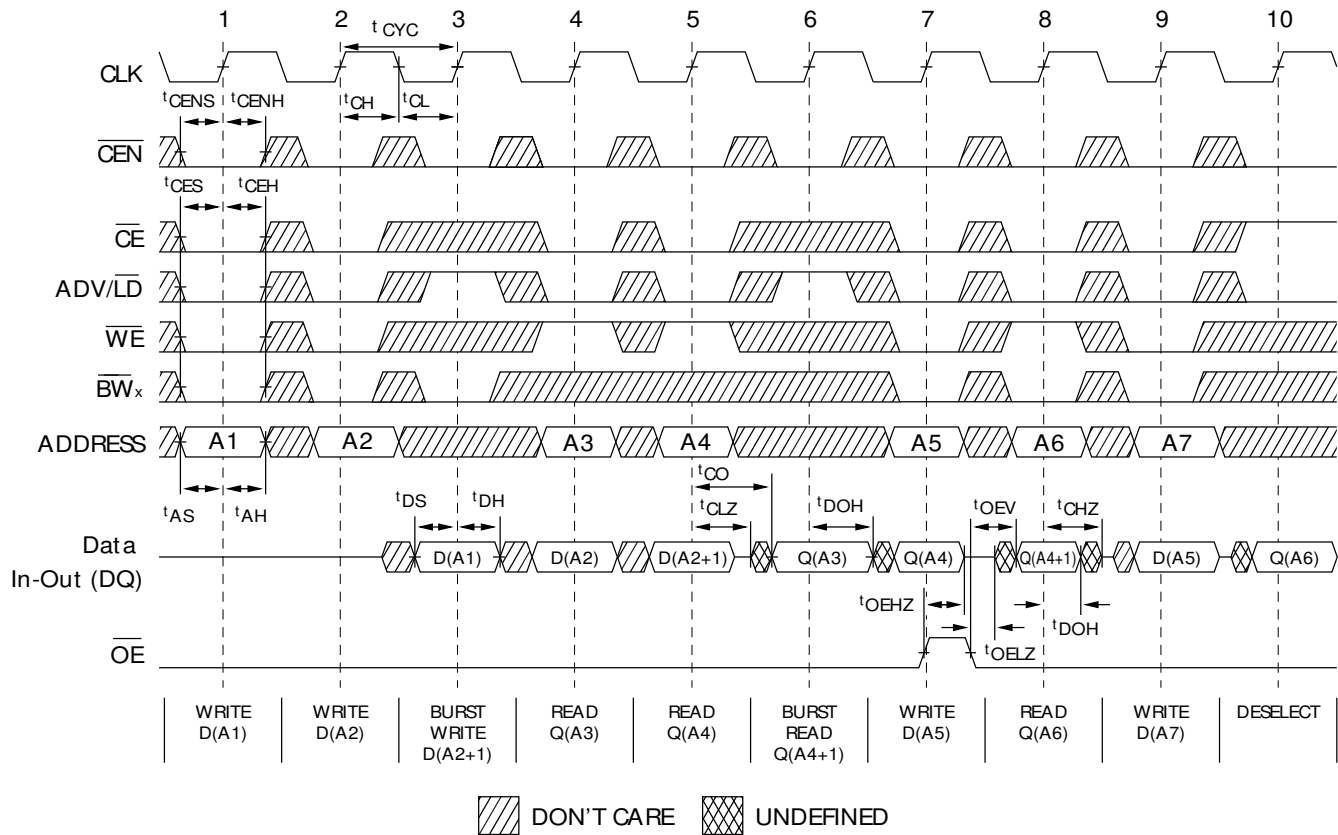

25.  $t_{CHZ}$ ,  $t_{CLZ}$ ,  $t_{EOLZ}$ , and  $t_{EOHZ}$  are specified with AC test conditions shown in (b) of Figure 4 on page 20. Transition is measured  $\pm 200$  mV from steady-state voltage.

26. At any given voltage and temperature,  $t_{EOHZ}$  is less than  $t_{EOLZ}$  and  $t_{CHZ}$  is less than  $t_{CLZ}$  to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve High Z prior to Low Z under the same system conditions.

27. This parameter is sampled and not 100% tested.

## Switching Waveforms

Figure 5. Read/Write/Timing [28, 29, 30]

### Notes

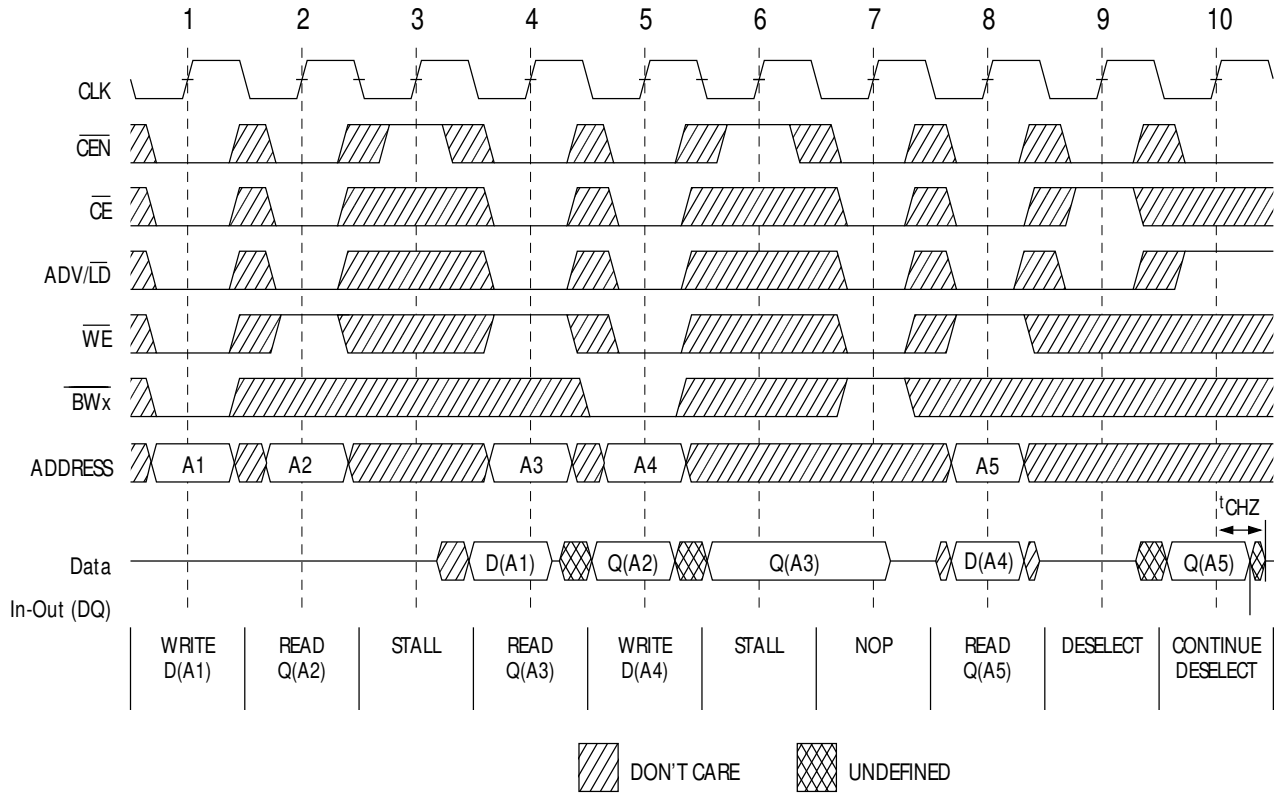

28. For this waveform ZZ is tied LOW.

29. When CE is LOW, CE<sub>1</sub> is LOW, CE<sub>2</sub> is HIGH and CE<sub>3</sub> is LOW. When CE is HIGH, CE<sub>1</sub> is HIGH or CE<sub>2</sub> is LOW or CE<sub>3</sub> is HIGH.

30. Order of the Burst sequence is determined by the status of the MODE (0 = Linear, 1 = Interleaved). Burst operations are optional.

**Switching Waveforms** (continued)

**Figure 6. NOP, STALL and DESELECT Cycles** [31, 32, 33]

**Figure 7. ZZ Mode Timing** [34, 35]

**Notes**

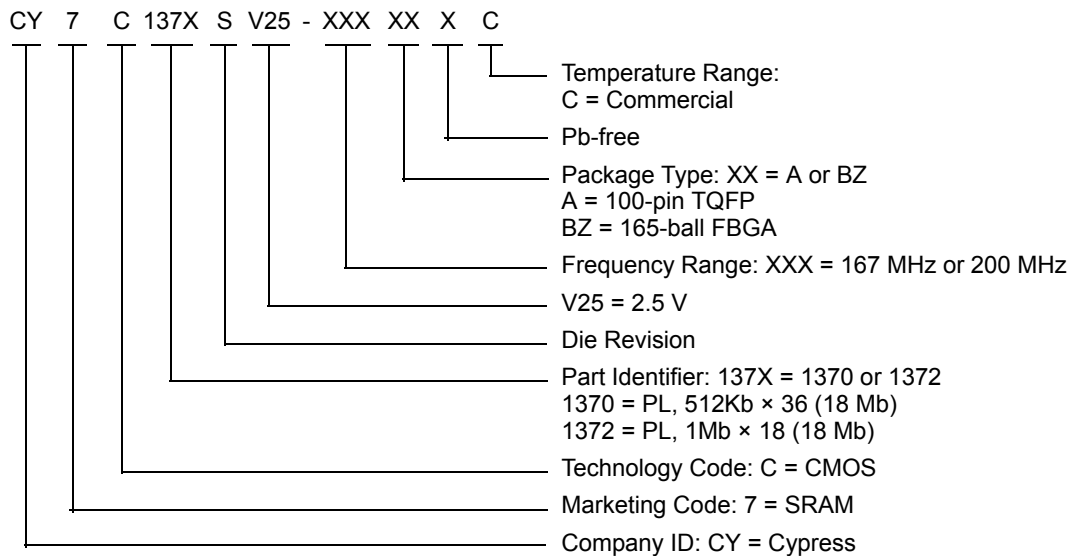

- 31. For this waveform ZZ is tied LOW.
- 32. When  $\overline{CE}$  is LOW,  $\overline{CE}_1$  is LOW,  $\overline{CE}_2$  is HIGH and  $\overline{CE}_3$  is LOW. When  $\overline{CE}$  is HIGH,  $\overline{CE}_1$  is HIGH or  $\overline{CE}_2$  is LOW or  $\overline{CE}_3$  is HIGH.
- 33. The Ignore Clock Edge or Stall cycle (Clock 3) illustrated  $\overline{CEN}$  being used to create a pause. A write is not performed during this cycle.
- 34. Device must be deselected when entering ZZ mode. See cycle description table for all possible signal conditions to deselect the device.
- 35. IOs are in High Z when exiting ZZ sleep mode.

## Ordering Information

The table contains only the parts that are currently available. If you do not see what you are looking for, contact your local sales representative. For more information, visit the Cypress website at [www.cypress.com](http://www.cypress.com) and refer to the product summary page at <http://www.cypress.com/products>.

| Speed(MHz) | Ordering Code       | Package Diagram | Part and Package Type                   | Operating Range |

© Cypress Semiconductor Corporation 2008-2016. This document is the property of Cypress Semiconductor Corporation and its subsidiaries, including Spansion LLC ("Cypress"). This document, including any software or firmware included or referenced in this document ("Software"), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you under its copyright rights in the Software, a personal, non-exclusive, nontransferable license (without the right to sublicense) (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units. Cypress also grants you a personal, non-exclusive, nontransferable, license (without the right to sublicense) under those claims of Cypress's patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely to the minimum extent that is necessary for you to exercise your rights under the copyright license granted in the previous sentence. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage ("Unintended Uses"). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and Company shall and hereby does release Cypress from any claim, damage, or other liability arising from or related to all Unintended Uses of Cypress products. Company shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.
