Features

- Dual Outputs:
  +3.3V/2.5V
  +3.3V/1.5V
  +3.3V/1.8V
- Adjustable Output Voltages
- Remote Sense (both outputs)
- Standby Function
- Over-Temperature Protection
- Soft-Start
- Internal Sequencing
- 23-pin Excalibur™ Package

Description

The PT6930 Excalibur™ series of 8-A dual-output ISRs are designed to power DSP ICs. Both output voltages are independently adjustable with external resistors. The second output may also be set to an alternate lower bus voltage with a simple pin strap. Internal power sequencing of both outputs, during both power-up and power-down, meets the requirements of most DSP chipsets.

Standard Application

C_1/C_2 =Req'd 330μF electrolytic (See table footnotes)
C_3 =Optional 100μF electrolytic
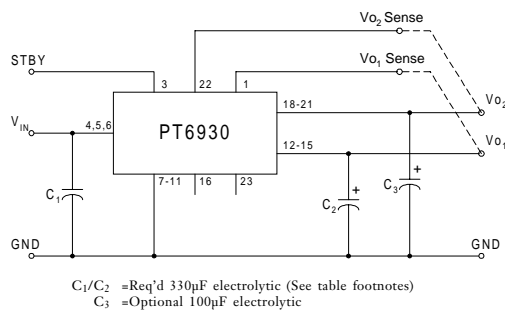

Pin-Out Information

Pin	Function	Pin	Function
1	V_{o1} Sense	13	V_{o1}
2	No Connect	14	V_{o1}

Notes: (1) I$_o$min current of 0.1A can be divided btween both outputs; Vo$_1$, or Vo$_2$. The ISR will operate down to no-load with reduced specifications.
(2) I$_o$max listed for each output assumes the maximum current drawn simultaneously on both outputs. Consult the factory for the absolute maximum.
(3) For operating temperatures below 0°C, use tantalum type capacitors at both the input and output.
(4) See Safe Operating Area curves for appropriate derating.

Input/Output Capacitors: *The PT6930 series requires a minimumm capacitance of 330µF at both the input and Vo$_1$ output for proper operation in all applications. In addition, the input capacitor, C$_1$, must be rated for a minimum of 1.0Arms ripple current. For transient or dynamic dynamic loads, additional capacitance may be required.*

Adjusting the Output Voltage of the PT6920 and PT6930 Dual Output Voltage ISRs

Each output voltage from the PT6920 and PT6930 series of ISRs can be independantly adjusted higher or lower than the factory trimmed pre-set voltage. Vo_1 or Vo_2 may each be adjusted either up or down using a single external resistor [2]. Table 1 gives the adjustment range for both Vo_1 and Vo_2 for each model in the series as $V_a(min)$ and $V_a(max)$. Note that Vo_2 must always be lower than Vo_1 [3].

Vo_1 Adjust Up: To increase the output, add a resistor R4 between pin 16 (V_1 Adjust) and pins 7-11 (GND) [2].

Vo_1 Adjust Down: Add a resistor (R3), between pin 16 (Vo_1 Adjust) and pin 1 (Vo_1 Sense) [2].

Vo_2 Adjust Up: Add a resistor R2 between pin 23 (Vo_2 Adjust) and pins 7-11 (GND) [2].

Vo_2 Adjust Down: Add a resistor (R1) between pin 23 (Vo_2 Adjust) and pin 22 (Vo_2 Sense) [2].

Refer to Figure 1 and Table 2 for both the placement and value of the required resistor.

Notes:

1. The output voltages, Vo_1 and Vo_2, may be adjusted independantly.

2. Use only a single 1% resistor in either the (R3) or R4 location to adjust Vo_1, and in the (R1) or R2 location to adjust Vo_2. Place the resistor as close to the ISR as possible.

3. Vo_2 must always be at least 0.2V lower than Vo_1.

4. Vo_2 on both the PT6921 and PT6931 models may be adjusted from 2.5V to 1.8V by simply connecting pin 22 (Vo_2 Sense) to pin 23 (Vo_2 Adjust). For more details, consult the data sheet.

5. If Vo_1 is increased above 3.3V, the minimum input voltage to the ISR must also be increased. The minimum required input voltage must be $(Vo_1 + 1.2)$V or 4.5V, whichever is greater. Do not exceed 5.5V

6. Never connect capacitors to either the Vo_1 Adjust or Vo_2 Adjust pins. Any capacitance added to these control pins will affect the stability of the respective regulated output.

7. Adjusting either voltage (Vo_1 or Vo_2) may increase the power dissipation in the regulator, and correspondingly change the maximum current available at either output. Consult the factory for application assistance.

The adjust up and adjust down resistor values can also be calculated using the following formulas. Be sure to select the correct formula parameter from Table 1 for the output and model being adjusted.

$$(R1) \text{ or } (R3) = \frac{R_o(V_a - V_r)}{V_o - V_a} - R_s \quad k\Omega$$

$$R2 \text{ or } R4 = \frac{V_r \cdot R_o}{V_a - V_o} - R_s \quad k\Omega$$

Where:
V_o = Original output voltage, (Vo_1 or Vo_2)
V_a = Adjusted output voltage
V_r = The reference voltage from Table 1
R_o = The resistance value from Table 1
R_s = The series resistance from Table 1

Using the Standby Function on the PT6920 and PT6930 Dual Output Voltage Converters

Both output voltages of the 23-pin PT6920/6930 dual output converter may be disabled using the regulator's standby function. This function may be used in applications that require power-up/shutdown sequencing, or wherever there is a requirement to control the output voltage On/Off status with external circuitry.

The standby function is provided by the *STBY** control (pin 3). If pin 3 is left open-circuit the regulator operates normally, and provides a regulated output at both Vo_1 (pins 12–15) and Vo_2 (pins 18–21) whenever a valid supply voltage is applied to V_{in} (pins 4, 5, & 6) with respect to GND (pins 7–11). If a low voltage [2] is then applied to pin 3, both regulator outputs will be simultaneously disabled and the input current drawn by the ISR will typcially drop to less than 30mA (50mA max). The standby control may also be used to hold-off both regulator outputs during the period that input power is applied.

The standby pin is ideally controlled using an open-collector (or open-drain) discrete transistor (See Figure 1). It may also be driven directly from a dedicated TTL[3] compatible gate. Table 1 provides details of the threshold requirements.

Table 1 Inhibit Control Thresholds [2,3]

| Parameter	Min	Max
Enable (V_{IH})	1.8V	Vin
Disable (V_{IL})	–0.1V	0.8V

Notes:

1. The Standby/Inhibit control logic is similar for all Power Trends' modules, but the flexibility and threshold tolerances will be different. For specific information on this function for other regulator models, consult the applicable application note.

2. The Standby control pin is ideally controlled using an open-collector (or open-drain) discrete transistor and requires no external pull-up resistor. To disable the regulator output, the control pin must be pulled to less than 0.8Vdc with a low-level 0.5mA sink to ground.

3. The Standby input on the PT6920/6930 series may be driven by a differential output device, making it directly compatible with TTL logic. The control input has an internal pull-up to the input voltage V_{in}. A voltage of 1.8V or greater ensures that the regulator is enabled. _Do not_ use devices that can drive the Standby control input above 5.5V or V_{in}.

Figure 1
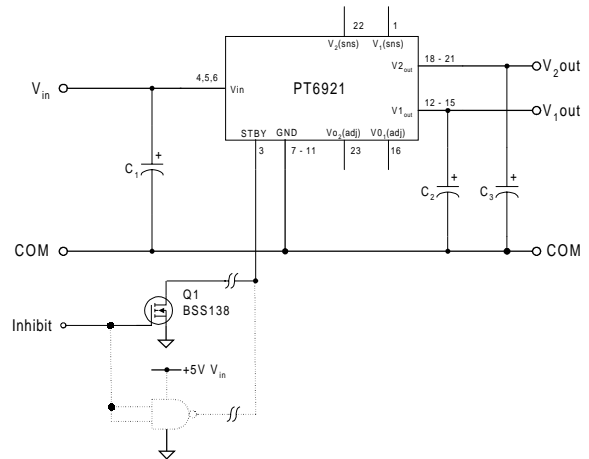

Turn-On Time: Turning Q_1 in Figure 1 off removes the low-voltage signal at pin 3 and enables both outputs from the PT6920/6930 regulator. Following a delay of about 10–20ms, Vo_1 and Vo_2 rise together until the lower voltage, Vo_2, reaches its set output. Vo_1 then continues to rise until both outputs reach full regulation voltage. The total power-up time is less than 25ms, and is relatively independant of load, temperature, and output capacitance. Figure 2 shows waveforms of the output voltages Vo_1 and Vo_2, for a PT6931 (3.3V/2.5V). The turn-off of Q_1 corresponds to the rise in V_{stby}. The waveforms were measured with a 5Vdc input voltage, and with resistive loads of 5A and 2A at the Vo_1 and Vo_2 outputs respectively.

Figure 2

TEXAS INSTRUMENTS
Capacitor Recommendations for the Dual-Output PT6920/30 Regulator Series

Input Capacitors:
The recommended input capacitance is determined by 1.0 ampere minimum ripple current rating and 330µF minimum capacitance (300µF for Oscon® or low ESR tantalum). Ripple current and <100mΩ equivalent series resistance (ESR) values are the major considerations, along with temperature, when designing with different types of capacitors. Tantalum capacitors have a recommended minimum voltage rating of $2 \times$ the maximum DC voltage + AC ripple. This is necessary to insure reliability for input voltage bus applications.

Output Capacitors: C_2(Required), C_3(Optional)
The ESR of the required capacitor (C_2) must not be greater than 150mΩ. Electrolytic capacitors have poor ripple performance at frequencies greater than 400kHz but excellent low frequency transient response. Above the ripple frequency, ceramic capacitors are necessary to improve the transient response and reduce any high frequency noise components apparent during higher current excursions. Preferred low ESR type capacitor part numbers are identified in Table 1. The optional 100µF capacitor (C_3) for Vo$_2$ can have an ESR of up to 200mΩ for optimum performance and ripple reduction. *(Note: Vendor part numbers for the optional capacitor, C_3, are not identified in the table. Use the same series selected for C_2)*

Tantalum Capacitors
Tantalum type capacitors can be used for the output but only the AVX TPS series, Sprague 593D/594/595 series or Kemet T495/T510 series. The AVX TPS series, Kemet or Sprague series tantalums are recommended over many other types due to their higher rated surge, power dissipation, and ripple current capability. As a caution the TAJ series by AVX is not recommended. This series has considerably higher ESR, reduced power dissipation and lower ripple current capability. The TAJ Series is a less reliable when compared to the AVX TPS series when determining power dissipation capability. Tantalum types are recommended for applications where ambient temperatures fall below 0°C.

Capacitor Table
Table 1 identifies the characteristics of capacitors from a number of vendors with acceptable ESR and ripple current (rms) ratings. The number of capacitors required at both the input and output buses is identified for each capacitor type.

This is not an extensive capacitor list. Capacitors from other vendors are available with comparable specifications. Those listed are for guidance. The RMS ripple current rating and ESR (Equivalent Series Resistance at 100kHz) are critical parameters necessary to insure both optimum regulator performance and long capacitor life.
