# 1. Overview

## 1.1 Product Description

---

Ferri-eMMC<sup>®</sup> is a highly integrated solution which combines a feature-wise flash controller and standard NAND flash memory. Its high performance and low power make the Ferri-eMMC a fabulous solution for embedded and portable applications.

The Ferri-eMMC leverages industry leading technology and experience in NAND management. In addition, the Ferri-eMMC supports the standard eMMC interface as well as the newly introduced eMMC features such as HS400 mode and FFU. By integrating all the advanced techniques, the Ferri-eMMC is able to further enhance the data transferring efficiency and optimizes the overall performance for embedded systems.

Available in various densities, the Ferri-eMMC offers the features, performance, and flexibility exactly for mobile handset, navigation, automotive infotainment, multi-function printer, and next-generation consumer applications. With extended temperature support and high data reliability, offering easy and rapid design integration, the Ferri-eMMC also ideally fits the requirements of point-of-sale terminals, networking and telecommunications equipment, and a variety of leading-edge industrial applications.

## 1.2 Key Features

---

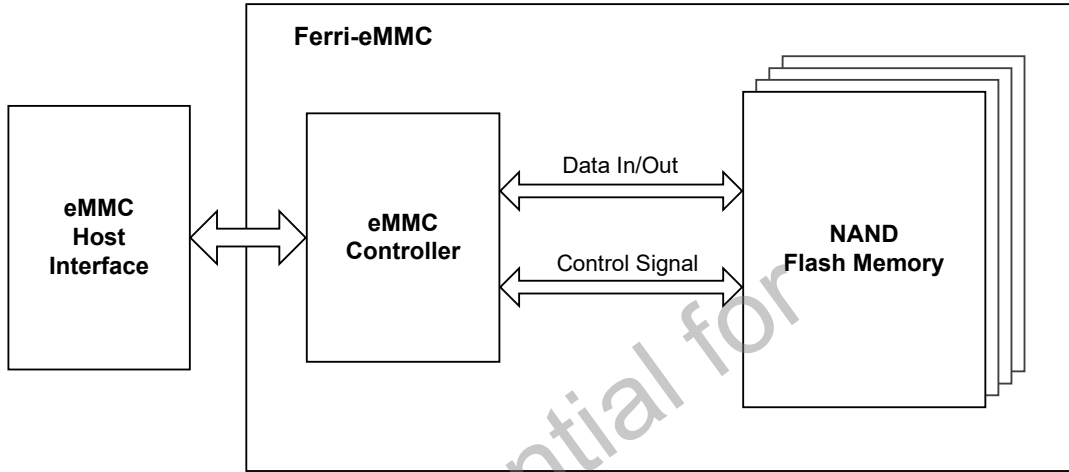

- Industrial Standard Interface
  - JEDEC eMMC Standard Version 5.1 Compliant
- eMMC 5.1 Enhanced Features
  - 11-signal interface (including CMD, CLK, DAT[7:0], and RST\_n)
  - Programmable bus width: 1-bit, 4-bit, and 8-bit
  - Supports HS400 high speed interface timing mode up to 400MB/s data rate
  - Up to 200MHz clock frequency
  - Supports eMMC Field firmware update (FFU)
  - Supports eMMC production state awareness (PSA)
  - Supports eMMC device health report
  - High-speed, Dual Data Rate Boot support
  - Supports Boot and Alternative Boot Mode
  - Replay Protected Memory Block (RPMB)
  - Trim, Sanitize, Discard, Secure Erase, Secure Trim
  - Enhanced Partition Attributes
  - High Priority Interrupt (HPI)
  - Background Operations
  - Enhanced Reliable Write
  - Supports Command Queuing
  - Supports Enhanced Strobe in HS400 Mode
  - Supports eMMC Background Operation Control

- Supports eMMC configuration up to 8 general purpose partitions and 4 RPMB regions
- Supports eMMC CMDQ Enhanced Data Task
- Supports eMMC CMDQ Device Management Operation
  
- Robust Data Protection and Endurance
  - Configurable ECC engine with zero overhead pipeline greatly reduces data loss rates and increases data endurance
  - Enhanced Write Protection with Permanent, Temporary and Power-On protection options
  - StaticDataRefresh and EarlyRetirement technologies ensure the data reliability
  - PowerShield and DataPhoenix technologies support power-down data protection
  - Global wear leveling maximizes product lifespan with minimal wear leveling and write amplification overhead
  
- Supply Voltage
  - eMMC Interface Power (VCCQ): 1.70–1.95V
  - eMMC Interface Power (VCCQ): 2.7–3.6V<sup>1</sup>
  - NAND Memory Power (VCC): 2.7–3.6V
  
- Dynamic power management technology enables multiple power saving modes
  
- Multiple Densities and Packages
  - Available in 32GB, 64GB, 128GB, 256GB and 512GB full 3D TLC mode density
  - 100-ball and 153-ball standard BGA packages
  - Green Package and RoHS Compliant
  
- Operating Temperature
  - Commercial Grade: -25°C ~ +85°C
  - Industrial Grade: -40°C ~ +85°C
  - Automotive Grade 3: -40°C ~ +85°C
  - Automotive Grade 2: -40°C ~ +105°C

<sup>1</sup> HS200 and HS400 mode are not supported when VCCQ is in 2.7–3.6V.

## 2.2 Signal Descriptions

**Table 1: Functional Signals**

Signal	Type	Description
CLK	Input	Clock. Each cycle of the clock directs a transfer on the command line and on the data line(s). The frequency can vary between the minimum and the maximum clock frequency.
RCLK	Output	eMMC interface data strobe (HS400 mode)
CMD	I/O	Command. This signal is a bidirectional command channel used for command and response transfers. The CMD signal has two bus modes: open-drain mode and push-pull mode. Commands are sent from the MMC host to the device, and responses are sent from the device to the host.
DAT0 – DAT7	I/O	Data I/O. These are bidirectional data signals. The DAT signals operate in push-pull mode. By default, after power-up or assertion of the RST_n signal, only DAT0 is used for data transfer. The MMC controller can configure a wider data bus for data transfer using either DAT[3:0] (4-bit mode) or DAT[7:0] (8-bit mode). eMMC includes internal pull-up resistors for data lines DAT[7:1]. Immediately after entering the 4-bit mode, the device disconnects the internal pull-up resistors on the DAT[3:1] lines. Correspondingly, immediately after entering the 8-bit mode, the device disconnects the internal pull-ups on the DAT[7:1] lines.
RST_n	Input	Reset. The RST_n signal is used for host resetting device, moving the device to pre-idle state. By default, the RST_n signal is temporary disabled in device. The host must set bits[1:0] in the extended CSD register [162] to 0x1 to enable this functionality before the host can use it.
VCC	Supply	NAND interface I/O and NAND Flash power supply.
VCCQ	Supply	eMMC controller core and eMMC interface I/O power supply.
VSS	Supply	NAND interface I/O and NAND Flash ground connection.
VSSQ	Supply	eMMC controller core and eMMC interface ground connection.
VDDi	-	Internal voltage node A 1.0uF capacitor is required for VDDi for core power stabilization. Do not tie to supply voltage or ground.
TX	Output	UART Tx output for debug use

Table 2: Miscellaneous Signals

Signal	Type	Description
NC	-	No connect
RFU	-	Reserved for future use. Leave it floating.

## 2.3 Pin List

**Table 3: Pin List of Ferri-eMMC Packages**

Signal	Pin NO. of 100-Ball	Pin NO. of 153-Ball
CLK	P6	M6
RCLK	K5, P7	H5
CMD	P5	M5
DAT0 – DAT7	K2, N2, K3, N3, N8, K8, N9, K9	A3, A4, A5, B2, B3, B4, B5, B6
RST_n	M5	K5
VCC	F2 - F9	E6, F5, J10, K9
VCCQ	H3, H8, L2, L4, L7, L9, P3, P8	C6, M4, N4, P3, P5
VSS	G2 - G9, J5	A6, E7, G5, H10, J5, K8
VSSQ	H2, H9, L3, L8, M4, M7, P2, P9	C4, N2, N5, P4, P6
VDDi	E4	C2
TX	D9	P7
NC	A1, A2, A9, A10, B1, B10, D8, T1, T10, U1, U2, U9, U10	A1, A2, A8 - A14, B1, B7 - B14, C1, C3, C5, C7 - C14, D1 - D4, D12 - D14, E1 - E3, E12 - E14, F1 - F3, F12 - F14, G1, G2, G12 - G14, H1 - H3, H12 - H14, J1 - J3, J12 - J14, K1 - K3, K12 - K14, L1 - L3, L12 - L14, M1 - M3, M7 - M14, N1, N3, N6 - N14, P1, P2, P8 - P14
RFU	D2 - D7, E2, E3, E5 - E9, H4 - H7, J2 - J4, J6 - J9, K4, K6, K7, L5, L6, M2, M3, M6, M8, M9, N4 - N7, P4	A7, E5, E8, E9, E10, F10, G3, G10, K6, K7, K10

### 3. Ferri-eMMC Registers

This chapter introduces the registers for eMMC and the defaulted register values in the Ferri-eMMC. The following table presents the register list of current specification.

Within the device the following registers are defined: OCR, CID, CSD, EXT\_CSD, and RCA. These can be accessed only by corresponding commands (see eMMC specification). The OCR, CID and CSD registers carry the card/content specific information, while the RCA and DSR registers are configuration registers storing actual configuration parameters. The EXT\_CSD register carries both, card specific information and actual configuration parameters.

#### 3.1 OCR Register

---

For eMMC devices, the OCR (operation conditions register) response is fixed. The value could be either 0x00FF8080 (for storage capacity of up to 2GB) or 0x40FF8080 (for storage capacity greater than 2GB) depending on the capacity.

#### 3.2 CID Register

---

Users can define their own CID (Device IDentification) register by using Silicon Motion's mass production utilities. The CID contents will be programmed into eMMC during the specified flow. After the programming is complete, end users cannot change CID, unless the whole foundry production program is re-done.

#### 3.3 Relative Card Address Register (RCA)

---

The writable 16-bit relative card address register stores the card address. This address is published by the card during card identification, and is used for host-card communication following the card identification procedure. The default value of the RCA register is 0x0001. The value 0x0000 is reserved for setting all cards in the Stand-by State with CMD7.

### 3.4 CSD Register

The Device-Specific Data (CSD) register defines the behavior of eMMC devices. The eMMC behavior is related to the controller design. The following table shows a typical CSD definition of the Ferri-eMMC. If users need to add on more features, firmware or hardware modifications may be necessary.

**Table 4: Ferri-eMMC Typical CSD Register**

Name	Field	Bit	Type	Slice	Value	Note
CSD structure	CSD_STRUCTURE	2	R	[127:126]	3h	
System specification version	SPEC_VERS	4	R	[125:122]	4h

Not used, always '1'	-	1	-	[0:0]	1h	

**Notes:**

1. The definitions of cell type are shown as follows:

R: Read only.

W: One time programmable and not readable.

R/W: One time programmable and readable.

W/E: Multiple writable with value kept after power failure, H/W reset assertion and any CMD0 reset and not readable.

R/W/E: Multiple writable with value kept after power failure, H/W reset assertion and any CMD0 reset and readable.

R/W/C\_P: Writable after value cleared by power failure and H/W reset assertion (the value not cleared by CMD0 reset) and readable.

R/W/E\_P: Multiple writable with value reset after power failure, H/W reset assertion and any CMD0 reset and readable.

W/E\_P: Multiple writable with value reset after power failure, H/W reset assertion and any CMD0 reset and not readable.

2. Reserved bits should be read as "0".

3. The column marked with "-" is undefined.

Only

### 3.5 Extended CSD Register (EXT\_CSD)

The Extended CSD register defines the additional behavior of eMMC devices due to limited CSD information. The following table shows a typical extended CSD definition of the Ferri-eMMC. If users need to add on more features, firmware or hardware modifications may be necessary. The register is 512 bytes long. The most significant 320 bytes are the Properties segment, which defines the Device capabilities and cannot be modified by the host. The lower 192 bytes are the Modes segment, which defines the configuration the Device is working in.

**Table 5: Ferri-eMMC Typical EXT\_CSD Register**

Name	Field	Byte	Type	Slice	Value	Note
Reserved	-	6	-	[511:506]	-

**Notes:**

1. The definitions of cell type are shown as follows:

R: Read only.

W: One time programmable and not readable.

R/W: One time programmable and readable.

W/E: Multiple writable with value kept after power failure, H/W reset assertion and any CMD0 reset and not readable.

R/W/E: Multiple writable with value kept after power failure, H/W reset assertion and any CMD0 reset and readable.

R/W/C\_P: Writable after value cleared by power failure and H/W reset assertion (the value not cleared by CMD0 reset) and readable.

R/W/E\_P: Multiple writable with value reset after power failure, H/W reset assertion and any CMD0 reset and readable.

W/E\_P: Multiple writable with value reset after power failure, H/W reset assertion and any CMD0 reset and not readable.

2. Reserved bits should be read as "0".

3. The column marked with "-" is undefined.

## 4. DC Electrical Characteristics

**Table 6: Operating Conditions**

Parameter	Symbol	Min	Max	Unit
Supply Voltage (NAND)	VCC	2.7	3.6	V
Supply Voltage (I/O)	VCCQ	1.7	1.95	V
		2.7	3.6	V
Supply Power-up for 3.3V	tPRUH		35	ms
Supply Power-up for 1.8V	tPRUL		25	ms
Operating Temperature (Commercial Grade)	T <sub>OPR</sub>	-25	+85	°C
Operating Temperature (Industrial Grade)	T <sub>OPR</sub>	-40	+85	°C
Operating Temperature (Automotive Grade 3)	T <sub>OPR</sub>	-40	+85	°C
Operating Temperature (Automotive Grade 2)	T <sub>OPR</sub>	-40	+105	°C

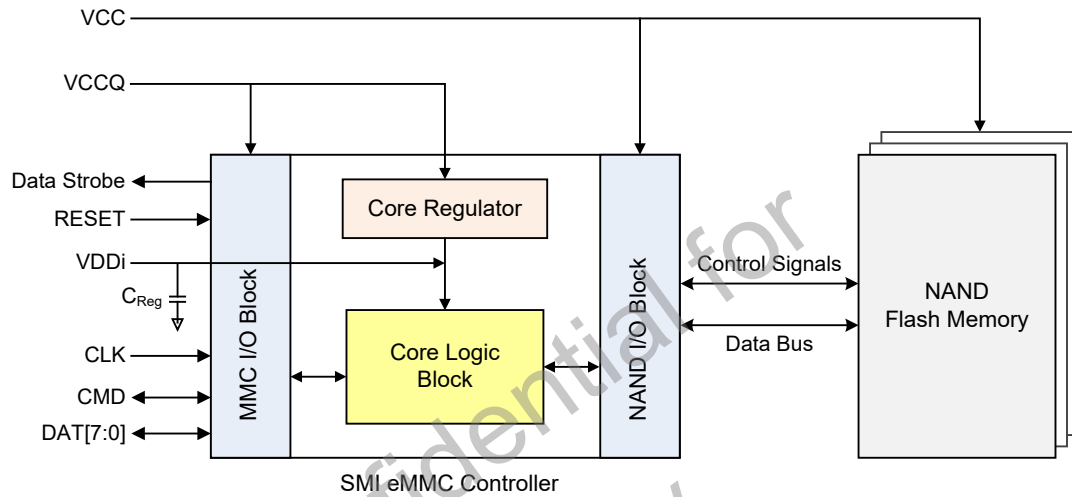

**Table 7: Absolute Maximum Ratings**

Parameter	Symbol	Min	Max	Unit
Voltage Input	V <sub>IN</sub>	-0.3	4.0	V
VCC Supply	VCC	-0.3	4.0	V
VCCQ Supply	VCCQ	-0.3	4.0	V
Storage Temperature (Commercial Grade)	T <sub>STG</sub>	-25	+85	°C
Storage Temperature (Industrial Grade)	T <sub>STG</sub>	-40	+105	°C
Storage Temperature (Automotive Grade 3)	T <sub>STG</sub>	-40	+85	°C
Storage Temperature (Automotive Grade 2)	T <sub>STG</sub>	-40	+105	°C

In the Ferri-eMMC, VCC is used for the NAND flash device; and VCCQ is for the controller and the eMMC interface voltage. A  $C_{Reg}$  capacitor must be connected to the VDDi terminal to stabilize regulator output on the system.

D2	---	11.00	---	fff	0.08		
E2	---	12.00	---	MD/ME	10/17		

Notes:  
 1. Controlling dimension: Millimeter.  
 2. Primary datum c and seating plane are defined by the spherical crowns of the solder balls.  
 3. Dimension b is measured at the maximum solder ball diameter, parallel to primary datum C.  
 4. The pattern of Pin 1 fiducial is for reference only.  
 5. Special characteristics C class: ccc, ddd.  
 6. This PKG is 100 balls + 58 test pins.
