Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. FAN7383

Half-Bridge Gate-Drive IC

Features

- Floating Channel Designed for Bootstrap Operation to +600V.
- Typically 350mA/650mA Sourcing/Sinking Current Driving Capability for Both Channels
- Extended Allowable Negative V_S Swing to -9.8V for Signal Propagation at $V_{DD}=V_{BS}=15V$
- High-Side Output in Phase of IN Signal
- Built-in UVLO Functions for Both Channels
- Built-in Common-Mode dv/dt Noise Canceling Circuit
- Typically Internal 330ns Minimum Dead-Time
- Programmable Turn-On Delay Time Control (Dead-Time)

Applications

- SMPS
- Motor Drive Inverter
- Fluorescent Lamp Ballast
- HID Ballast

Description

The FAN7383 is a half-bridge gate-drive IC with shutdown and programmable dead-time control functions for driving MOSFETs and IGBTs that operate up to +600V.

Fairchild's high voltage process and common-mode noise canceling technique give stable operation of high-side drivers under high-dv/dt noise circumstances.

An advanced level-shift circuit allows high-side gate driver operation up to $V_S = -9.8V$ (typical) for $V_{BS} = 15V$.

The UVLO circuits for both channels prevent malfunction when V_{DD} and V_{BS} are lower than the specified threshold voltage.

Output drivers typically source/sink 350mA/650mA, respectively, which is suitable for all kinds of half and full bridge inverter.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only. $T_A = 25^\circ\text{C}$ unless otherwise specified.

Typical Application Information

1. Normal Operating Consideration

The FAN7383 is a single PWM input half-bridge gate-drive IC with programmable dead-time and shutdown function.

The dead-time is set with a resistor (R_{DT}) at the DT pin. The wide dead-time programming range provides the flexibility to optimize drive signal timing for a selection of switching devices (MOSFET or IGBT) and applications.

The turn-on time delay circuitry (Dead-Time) accommodates resistor values from 0Ω to $200k\Omega$ with a dead-time proportional to the R_{DT} resistance.

Grounding the DT pin programs the FAN7383 to drive both outputs with minimum dead time.

If the \overline{SD} pin voltage decrease below 1.2V in normal operation, the IC enters the shutdown mode.

2. Under-Voltage Lockout (UVLO)

The FAN7383 has an under-voltage lockout (UVLO) protection circuitry for high and low side channels to prevent malfunction when V_{DD} or V_{BS} is lower than the specified threshold voltage. The UVLO circuitry monitors the supply voltage (V_{DD}) and bootstrap capacitor voltage (V_{BS}) independently.

3. Layout Consideration

For optimum performance of high- and low-side gate drivers, cannot be achieved without taking due considerations must be taken during printed circuit board (PCB) layout.

3.1 Supply Capacitors

If the output stages are able to quickly turn on the switching device with high value of current, the supply capacitors must be placed as close as possible to the device pins (V_{DD} and GND for the ground-tied supply, V_B and V_S for the floating supply) to minimize parasitic inductance and resistance.

3.2 Gate Drive Loop

Current loops behave like an antenna, able to receive and transmit noise. To reduce the noise coupling/emission and improve the power switch turn-on and off performances, gate drive loops must be reduced as much as possible.

3.3 Ground Plane

Ground plane must not be placed under or nearby the high-voltage floating side to minimize noise coupling.
