

Features

- Complementary Drive, Half-Bridge Power NMOS
- Use With Low-Cost Single-Output PWM Controllers
- Improve Efficiency Over Conventional Buck Converter With Schottky Clamp
- Minimum Deadtime Provided by Adaptive Shoot-Through Protection Eliminates External Schottky
- Grounded Case for Low EMI and Simple Heatsinking
- Low Operating Current
- Frequency Exceeding 1MHz
- Dual Polarity Input Options
- All Pins Surge Protected

Applications

- 5V to $\leq 3.3V$ Synchronous Buck Converters
- Pentium™ and P6™ Power Supplies
- PowerPC™ Power Supplies
- Bus Terminations (BTL and GTL)
- Drive 5V Motors Directly from Microprocessor

Description

Designed with the P6 and Pentium in mind, the Harris SynchroFET™ family provides a new approach for implementing a synchronous rectified buck switching regulator. The SynchroFET™ replaces two power DMOSs, a Schottky diode, two gate drivers and synchronous control circuitry. The complementary drive circuit turns the upper FET on and the lower FET off when the input from the PWM is high. When the input from the PWM goes low the upper FET turns off and the lower FET turns on. The HIP5011 has a PWM pin that inverts the relationship from the input to PHASE. This architecture allows the designer to utilize a low cost single-ended PWM controller in either a current or voltage mode configuration. The SynchroFET™ operates in continuous conduction mode reducing EMI constraints and enabling high bandwidth operation. Several features ensure easy start-up. First, the supply currents stay below specification as the supply voltages ramp up; no unexpected surges occur that might perturb a soft-start or deplete a charge-pump. Second, any power-up sequence of the V_{CC} , V_{IN} , or PWM pins can be used without causing large currents. Third, the chip operates when V_{CC} is greater than 2V so V_{CC} can be created from a charge pump powered from V_{IN} .

Pin Descriptions

SYMBOL	DESCRIPTION
V_{CC}	Positive supply to control logic and gate drivers. De-couple this pin to GND.
V_{IN}	FET Switch Input Voltage. De-couple this pin to GND. Tie all V_{IN} terminals together.
PHASE	Output. Tie all phase terminals together.
PWM (HIP5010) PWM (HIP5011)	Single Ended Control Input. This input connects to the PWM controller output.
GND	System Ground.

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch)
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
