- NOTES:**
1. Derated linearly 0.2 W/°C for T<sub>C</sub> > +25 °C
  2. The following formula derives the maximum theoretical I<sub>D</sub> limit. I<sub>D</sub> is limited by package and internal wires and may also be limited by pin diameter:

$$I_D = \sqrt{\frac{T_J(\text{max}) - T_C}{R_{\theta JC} \times r_{DS(on)} @ T_J(\text{max})}}$$

3. See [Figure 3](#) for maximum drain current graphs
4. I<sub>DM</sub> = 4 X I<sub>D1</sub> as calculated in note (2)

**SEE (Single Event Effect) Typical Response:**

Heavy Ion testing of the 2N7389 device has been characterized at the Texas A&M cyclotron. The following SEE curve has been established using the elements, LET, range, and Total Energy conditions as shown:

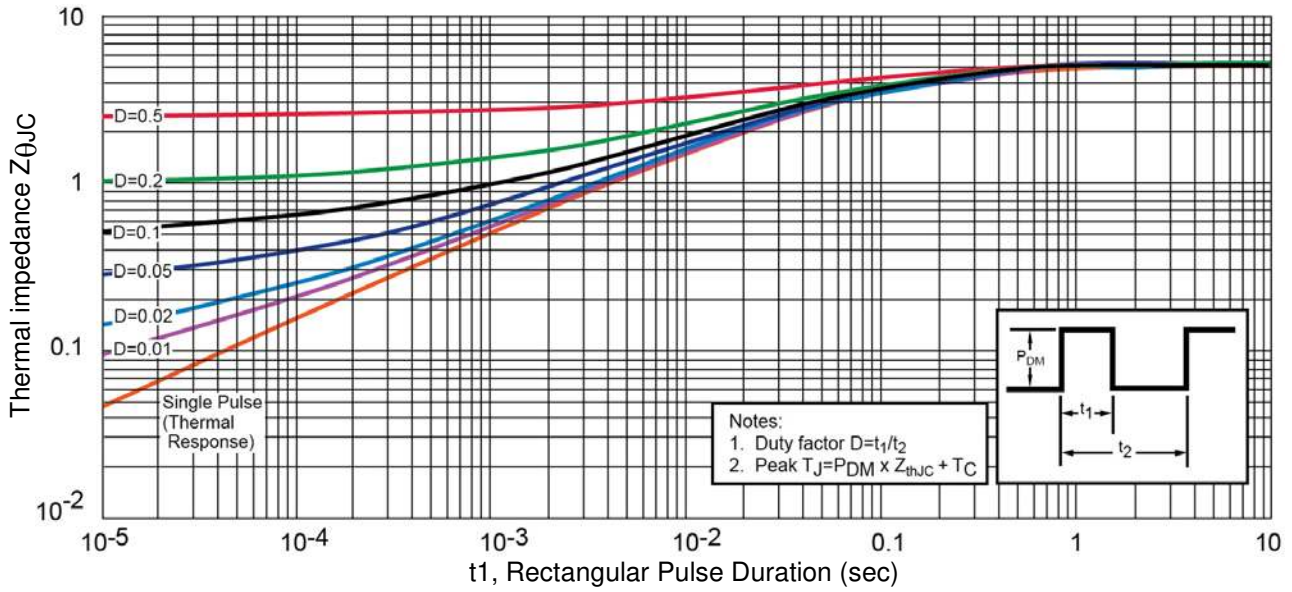

**FIGURE 2**

It should be noted that total energy levels are considered to be a factor in SEE characterization. Comparisons to other datasets should not be based on LET alone. Please consult factory for more information.
