DDR Clock Oscillator

DS4266

General Description

The DS4266 surface-mount ceramic crystal oscillator is part of Maxim's DS4-XO crystal oscillator product family. The DS4266 is a 266MHz crystal oscillator designed to support high-performance DDR memory applications that require a stable, low-jitter, and tight duty-cycle clock source. The device provides an overall accuracy and stability better than ±50ppm, including aging. Jitter performance is better than 0.7ps$_{RMS}$ typically over a 12kHz to 20MHz bandwidth, and duty-cycle performance is better than 48%/52%.

The DS4266 has an output frequency of 266MHz, and it supports LVDS and LVPECL output types. The DS4266 is constructed using a fundamental crystal in conjunction with high-performance silicon germanium PLL technology, enabling very low phase noise and phase jitter performance. The device operates from a 3.3V ±5% power supply and consumes a maximum current of 100mA.

The DS4266 is packaged in a miniature 5mm x 3.2mm x 1.49mm, 10-lead LCCC ceramic package, making it suitable for applications where board space is critical.

Features

- **< 0.7ps$_{RMS}$ (typ) from 12kHz to 20MHz Jitter**
- **LVDS or LVPECL Output Types**
- **3.3V Operating Voltage**
- **5.0mm x 3.2mm x 1.49mm, 10-Pin LCCC Ceramic Package**
- **-40°C to +85°C Operating Temperature Range**
- **Lead-Free/RoHS Compliant**

Detailed Description

The DS4266 consists of a fundamental-mode crystal and synthesizer IC packaged in a 5mm x 3.2mm x 1.49mm, 10-pin LCCC ceramic package. The device produces a frequency output of 266.00MHz. Two differential output types are available: LVDS and LVPECL. The device output can be enabled or disabled through the OE signal input. When the OE signal is low, LVPECL outputs go to the PECL_BAS level of V_{CC} - 2.9V, while the LVDS outputs are a logical 1. See Figures 2 and 3 for LVDS and LVPECL output timing diagrams.
