

Quad, Low-Power, 500Mbps ATE Driver/Comparator

MAX9963/MAX9964

General Description

The MAX9963/MAX9964 four-channel, low-power, high-speed pin electronics driver and comparator ICs include, for each channel, a three-level pin driver, a dual comparator, and variable clamps. The driver features a wide voltage range and high-speed operation, includes high-Z and active-termination (3rd-level drive) modes, and is highly linear even at low-voltage swings. The dual comparator provides low dispersion (timing variation) over a wide variety of input conditions. The clamps provide damping of high-speed DUT waveforms when the device is configured as a high-impedance receiver. High-speed, differential control inputs compatible with ECL, LVPECL, LVDS, and GTL levels are provided for each channel. ECL/LVPECL or flexible open-collector outputs are available for the comparators.

The A-grade version provides tight matching of gain and offset for the drivers and comparators, allowing reference levels to be shared across multiple channels in cost-sensitive systems. For system designs that incorporate independent reference levels for each channel, the B-grade version is available at reduced cost.

Optional internal resistors at the high-speed inputs provide differential termination of LVDS inputs, while optional internal resistors provide the pullup voltage and source termination for open-collector comparator outputs. These features significantly reduce the discrete component count on the circuit board.

Low-leakage, slew rate, and tri-state/terminate controls are operational configurations that are programmed through a 3-wire, low-voltage, CMOS-compatible serial interface.

The MAX9963/MAX9964 operating range is -1.5V to +6.5V, with power dissipation of only 825mW per channel.

These devices are available in a 100-pin, 14mm x 14mm body, 0.5mm pitch TQFP with an exposed 8mm x 8mm die pad on the top (MAX9963) or bottom (MAX9964) of the package for efficient heat removal. The MAX9963/MAX9964 are specified to operate with an internal die temperature of +70°C to +100°C, and feature a die temperature monitor output.

Applications

Flash Memory Testers
Commodity DRAM Testers
Low-Cost Mixed-Signal/System-on-Chip Testers
Active Burn-In Systems
Structural Testers

Features

- ◆ Small Footprint—Four Channels in 0.4in²
- ◆ Low Power Dissipation: 825mW/Channel (typ)
- ◆ High Speed: 500Mbps at 3V_{P-P}
- ◆ Low Timing Dispersion
- ◆ Wide -1.5V to +6.5V Operating Range
- ◆ Active Termination (3rd-Level Drive)
- ◆ Low-Leakage Mode: 15nA (max)
- ◆ Integrated Clamps
- ◆ Interface Easily with Most Logic Families
- ◆ Digitally Programmable Slew Rate
- ◆ Internal Logic Termination Resistors
- ◆ Low Gain and Offset Error

DHV ₋ , DLV ₋ , DTV ₋ , CHV ₋ , CLV ₋ to GND	-2.5V to +7.5V	Junction Temperature	+125°C
CPHV ₋ to GND	-2.5V to +8.5V	Lead Temperature (soldering, 10s)	+300°C
CPLV ₋ to GND	-3.5V to +7.5V		
DHV ₋ to DLV ₋	±10V		
DHV ₋ to DTV ₋	±10V		

*Dissipation wattage values are based on still air with no heat sink for the MAX9963 and slug soldered to board copper for the MAX9964. Actual maximum power dissipation is a function of the user's heat-extraction technique and will vary.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

($V_{CC} = +9.75V$, $V_{EE} = -5.25V$, $V_{CCO_} = 2.5V$, $SC1 = SC0 = 0$, $V_{CPHV_} = 7.2V$, $V_{CPLV_} = -2.2V$, $T_J = +85^{\circ}C$, unless otherwise noted. All temperature coefficients are measured at $T_J = +70^{\circ}C$ to $+100^{\circ}C$, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Voltage Gain	A_V		0.96		1.00	V/V
Voltage-Gain Temperature Coefficient				-100		ppm/ $^{\circ}C$
Clamp Linearity		$I_{DUT} = 1mA$, $V_{CPLV_} = -1.5V$, $V_{CPHV_} = -0.3$ to $6.5V$		± 10		mV
		$I_{DUT} = -1mA$, $V_{CPHV_} = 6.5V$, $V_{CPLV_} = -1.5$ to $5.3V$		± 10		
Short-Circuit Output Current		$V_{CPHV_} = 0$, $V_{CPLV_} = -1.5V$, $V_{DUT_} = 6.0V$	50		95	mA
		$V_{CPLV_} = 5V$, $V_{CPHV_} = 6.5V$, $V_{DUT_} = -1.0V$	-95		-50	
Clamp DC Impedance		$V_{CPHV_} = 3V$, $V_{CPLV_} = 0$, $I_{DUT} = -5mA$ and $-15mA$	50		55	Ω
		$V_{CPHV_} = 3V$, $V_{CPLV_} = 0$, $I_{DUT} = 5mA$ and $15mA$	50		55	

Note 1: All MIN and MAX limits are 100% tested in production.

Note 2: Total for quad device at worst-case setting. $R_{L_} \geq 10M\Omega$. The applicable supply currents are measured with typical supply voltages.

Note 3: Does not include internal dissipation of the comparator outputs. With output loads of 50Ω to $(V_{VCCO_} - 2V)$, this adds $240mW$ (typ) to the total chip power (MAX996__{HCCQ}, MAX996__{JCCQ}).

Note 4: Externally forced voltages may exceed this range provided that the absolute maximum ratings are not exceeded.

Note 5: Transition time from LLEAK being asserted to leakage current dropping below specified limits.

Note 6: Transition time from LLEAK being deasserted to output returning to normal operating mode.

Note 7: Based on simulation results only.

Note 8: With the exception of offset and gain/CMRR tests, reference input values are calibrated for offset and gain.

Note 9: Relative to straight line between 0 and 3V.

Note 10: Full ranges are $-1.3V \leq V_{DHFV_} \leq 6.5V$, $-1.5V \leq V_{DTV_} \leq 6.5V$, $-1.5V \leq V_{DLV_} \leq 6.3V$.

Note 11: Nominal target value is 50Ω . Contact factory for alternate trim selections within the 45Ω to 51Ω range.

Note 12: $V_{DTV_} = 1.5V$, $R_S = 50\Omega$. External signal driven into T-line is a 0 to 3V edge with 1.2ns rise time (10% to 90%). Measurement is made using the comparator.

Note 13: Measured from the crossing point of DATA_ _{inputs} to the settling of the driver output.

Note 14: Prop delays are measured from the crossing point of the differential input signals to the 50% point of expected output swing. Rise time of the differential inputs DATA_ _{and} RCV_ _{is} 250ps (10% to 90%).

Detailed Description

The MAX9963/MAX9964 four-channel, high-speed pin electronics driver and comparator ICs for automatic test equipment include, for each channel, a three-level pin driver, a dual comparator, and variable clamps (Figure 1). The driver features a -1.5V to +6.5V operating range and high-speed operation, including high-Z and active termination (3rd-level drive) modes, which is highly linear even at low-voltage swings. The comparator provides low timing dispersion regardless of changes in input slew rate and pulse width. The clamps provide damping of high-speed DUT_ waveforms when the device is configured as a high-impedance receiver.

Each of the four channels has high-speed, differential inputs compatible with ECL, LVPECL, LVDS, and GTL

signal levels, with optional 100Ω differential input terminations. Optional internal resistors at DATA_ and RCV_ provide differential termination of LVDS inputs. Optional internal resistors at CH_ and CL_ provide the pullup voltage and source termination for open-collector comparator outputs. These options significantly reduce the discrete component count on the circuit board.

The MAX9963/MAX9964 are available in two grade options. An A-grade version provides tighter matching of gain and offset of the drivers, and tighter offset matching of the comparators. This allows reference levels to be shared across multiple channels in cost-sensitive systems. A B-grade version provides lower cost for system designs that incorporate independent reference levels for each channel.

Table 2. Driver Logic

EXTERNAL CONNECTIONS		INTERNAL CONTROL REGISTER		DRIVER OUTPUT
DATA_	RCV_	TMSEL	LLEAK	
1	0	X	0	Drive to DHV_
0	0	X	0	Drive to DLV_
X	1	1	0	Drive to DTV_ (term mode)
X	1	0	0	High-impedance (high-z) mode
X	X	X	1	Low-leakage mode

The MAX9963/MAX9964 modal operation is programmed through a 3-wire, low-voltage CMOS-compatible serial interface.

Output Driver

The driver input is a high-speed multiplexer that selects one of three voltage inputs, DHV_, DLV_, or DTV_. This switching is controlled by high-speed inputs DATA_ and RCV_, and mode control bit TMSEL. A slew rate circuit controls the slew rate of the buffer input. One of four possible slew rates can be selected (Table 1). The slew rate of the internal multiplexer sets the 100% driver slew rate (see the Driver Large-Signal Response graph in the *Typical Operating Characteristics*).

DUT_ can be toggled at high speed between the buffer output and high-impedance mode, or it can be placed in low-leakage mode (Figure 2, Table 2). In high-impedance mode, the clamps are connected. This switching is controlled by high-speed input RCV_ and mode control bits TMSEL and LLEAK. In high-impedance mode, the bias current at DUT_ is less than 3μA, while the node maintains its ability to track high-speed signals. In

Quad, Low-Power, 500Mbps ATE Driver/Comparator

low-leakage mode, the bias current at DUT₋ is further reduced to less than 15nA, and signal tracking slows.

The nominal driver output resistance is 50Ω. Contact the factory for different resistance values within the 45Ω to 51Ω range.

Clamps

A pair of voltage clamps (high and low) can be configured to limit the voltage at DUT₋, and to suppress reflections when the channel is configured as a high-impedance receiver. The clamps behave as diodes connected to the outputs of high-current buffers. Internal circuitry compensates for the diode drop at 1mA clamp current. Set the clamp voltages using external connections CPHV₋ and CPLV₋. The clamps are enabled only when the driver is in the high-impedance mode (Figure 2). For transient suppression, set the clamp voltages to approximately the minimum and maximum expected DUT₋ voltage range. The optimal clamp voltages are application specific and must be empirically determined. If clamping is not desired, set the clamp voltages at least 0.7V outside the expected

0	1	0	1
1	0	1	0
1	1	1	1

Figure 3. Open-Collector Comparator Outputs

DUT₋ voltage range; overvoltage protection remains active without loading DUT₋.

Comparators

The MAX9963/MAX9964 have two independent high-speed comparators for each channel. Each comparator has one input connected internally to DUT₋ and the other input connected to either CHV₋ or CLV₋ (Figure 1). Comparator outputs are a logical result of the input conditions, as indicated in Table 3.

Three configurations are available for the comparator differential outputs to ease interfacing with a wide variety of logic families. An open-collector configuration switches an 8mA current source between the two outputs. This configuration is available with and without internal termination resistors connected to VCCO₋ (Figure 3). For versions without internal termination resistors, leave VCCO₋ unconnected and add the required external resistors. These resistors are typically 50Ω to the pullup voltage at the receiving end of the output trace. Alternate configurations can be used, provided that the Absolute Maximum Ratings are not exceeded. For versions with internal terminations, connect VCCO₋ to the desired VOH voltage. Each output provides a nominal 400mV_{P-P} swing and 50Ω source termination.

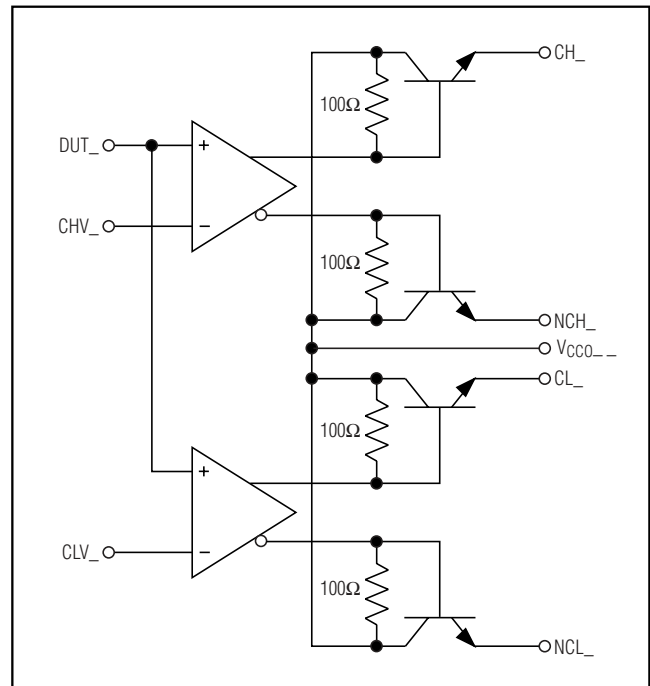

Figure 4. Open-Emitter Comparator Outputs

Quad, Low-Power, 500Mbps ATE Driver/Comparator

MAX9963/MAX9964

Table 4. Shift Register Functions

BIT	NAME	DESCRIPTION
D7	1E	Channel 1 Write Enable. Set to 1 to update the control byte for channel 1. Set to zero to make no changes to channel 1.
D6	2E	Channel 2 Write Enable. Set to 1 to update the control byte for channel 2. Set to zero to make no changes to channel 2.
D5	3E	Channel 3 Write Enable. Set to 1 to update the control byte for channel 3. Set to zero to make no changes to channel 3.
D4	4E	Channel 4 Write Enable. Set to 1 to update the control byte for channel 4. Set to zero to make no changes to channel 4.
D3	LLEAK	Low-Leakage Select. Set to 1 to put driver and clamps into a low-leakage mode. Comparators remain active in low-leakage mode. Set to zero for normal operation.
D2	SC1	Driver Slew-Rate Select. SC1 and SC0 set the driver slew rate. See Table 1.
D1	SC0	
D0	TMSEL	Driver Termination Select. Set to 1 to force the driver output to the DTV_ voltage (term mode) when RCV_ = 1. Set to zero to place the driver into a high-impedance state (high-Z mode) when RCV_ = 1. See Table 2.

An open-emitter configuration is also available (Figure 4). Connect an external collector voltage to $V_{CCO_}$ and add external pulldown resistors. These resistors are typically 50Ω to $V_{CCO_} - 2V$ at the receiving end of the output trace. Alternate configurations can be used, provided that the Absolute Maximum Ratings are not exceeded.

Low-Leakage Mode, LLEAK

Asserting LLEAK through the serial port or with \overline{RST} places the MAX9963/MAX9964 into a very-low-leakage state in which the DUT_ input current is less than 10nA over the 0 to 3V range. In this mode, the comparators still function at full speed but the driver and clamps are disabled. This mode is convenient for making IDDQ and PMU measurements without the need for an output disconnect relay. LLEAK is programmed independently for each channel.

If DUT_ is driven with a high-speed signal while LLEAK is asserted, leakage current momentarily increases beyond the limits specified for normal operation. The low-leakage recovery specification in the *Electrical Characteristics* table indicates device behavior under this condition.

Temperature Monitor

Each device supplies a single temperature output signal, TEMP, that asserts a nominal output voltage of 3.43V at a die temperature of +70°C (343K). The output voltage increases proportionately with temperature at a rate of 10mV/°C. The temperature sensor output impedance is 15kΩ (typ).

Figure 5. Serial Interface Timing

Quad, Low-Power, 500Mbps ATE Driver/Comparator

Serial Interface and Device Control

A CMOS-compatible serial interface controls the MAX9963/MAX9964 modes (Figure 6). Control data flow into an 8-bit shift register (MSB first) and are latched when \overline{CS} is taken high, as shown in Figure 5. Data from the shift register are then loaded into any or all of a group of four quad latches, determined by bits D4 through D7, as indicated in Figure 6 and Table 4. The quad latches contain the 4 mode bits for each channel of the quad pin driver. The mode bits, in conjunction with external inputs $DATA_{-}$ and RCV_{-} , manage the features of each channel, as shown in Tables 1 and 2. \overline{RST} sets $LLEAK=1$ for all channels, forcing them into low-leakage mode. All other bits are unaffected. At power-up, hold \overline{RST} low until V_{CC} and V_{EE} have stabilized.

Heat Removal

These devices require heat removal under normal circumstances through the exposed pad, either by soldering to circuit board copper (MAX9964) or by use of an external heat sink (MAX9963). The exposed pad is electrically at V_{EE} potential for both package types, and must be either connected to V_{EE} or isolated.
