

2 x 10-watt dual BTL class-D audio amplifier

Features

- 10 W + 10 W continuous output power:
 $R_L = 6 \Omega$, THD = 10% at $V_{CC} = 11 \text{ V}$
- 9.5 W + 9.5 W continuous output power:
 $R_L = 8 \Omega$, THD = 10% at $V_{CC} = 12 \text{ V}$
- Wide range single supply operation (5 V - 18 V)
- High efficiency ($\eta = 90\%$)
- Four selectable, fixed gain settings of nominally 20 dB, 26 dB, 30 dB and 32 dB
- Differential inputs minimize common-mode noise
- Filterless operation
- No 'pop' at turn-on/off
- Standby and mute features
- Short-circuit protection
- Thermal overload protection
- Externally synchronizable

Description

The TDA7491P is a dual BTL class-D audio amplifier with single power supply designed for LCD TVs and monitors.

Thanks to the high efficiency and exposed-pad-down (EPD) package no separate heatsink is required.

Furthermore, the filterless operation allows a reduction in the external component count.

The TDA7491P is pin-to-pin compatible with the TDA7491LP and TDA7491HV.

Table 1. Device summary

Order code	Operating temperature	Package	Packaging
TDA7491P	-40 to 85 °C	PowerSSO-36 EPD	Tube
TDA7491P13TR	-40 to 85 °C	PowerSSO-36 EPD	Tape and reel

4 Characterization curves

The following characterization curves were made using the TDA7491P demo board. The LC filter for the 4-Ω load uses components of 15 μH and 470 nF, whilst that for the 6-Ω load uses 22 μH and 220 nF and that for the 8-Ω load uses 33 μH and 220 nF.

5 Applications information

5.1 Applications circuit

Figure 39. Applications circuit for class-D amplifier

5.2 Mode selection

The three operating modes, defined below, of the TDA7491P are set by the two inputs STBY (pin 20) and MUTE (pin 21) as shown in [Table 6](#).

- Standby mode: all circuits are turned off, very low current consumption.
- Mute mode: inputs are connected to ground and the positive and negative PWM outputs are at 50% duty cycle.
- Play mode: the amplifiers are active.

The protection functions of the TDA7491P are implemented by pulling down the voltages of the STBY and MUTE inputs shown in [Figure 40](#). The input current of the corresponding pins must be limited to 200 μ A.

Table 6. Mode settings

Mode	Voltage level on pin STBY	Voltage level on pin MUTE
Standby	L ⁽¹⁾	X (don't care)
Mute	H ⁽¹⁾	L
Play	H	H

1. Refer to V_{STBY} and V_{MUTE} in [Table 5: Electrical specifications on page 11](#) for the drive levels for L and H

Figure 40. Standby and mute circuits

Figure 41. Turn-on/off sequence for minimizing speaker “pop”

5.3 Gain setting

The gain of the TDA7491P is set by the two inputs, GAIN0 (pin 30) and GAIN1 (pin 31). Internally, the gain is set by changing the feedback resistors of the amplifier.

Table 7. Gain settings

Voltage level on pin GAIN0	Voltage level on pin GAIN1	Nominal gain, G_v (dB)
L ⁽¹⁾	L ⁽¹⁾	20
L	H	26
H	L	30
H	H	32

1. Refer to V_{inL} and V_{inH} in [Table 5: Electrical specifications on page 11](#) for the drive levels for L and H

5.4 Input resistance and capacitance

The input impedance is set by an internal resistor $R_i = 68\text{ k}\Omega$ (typical). An input capacitor (C_i) is required to couple the AC input signal.

The equivalent circuit and frequency response of the input components are shown in [Figure 42](#). For $C_i = 220\text{ nF}$ the high-pass filter cut-off frequency is below 20 Hz:

$$f_c = 1 / (2 * \pi * R_i * C_i)$$

Figure 42. Device input circuit and frequency response

5.5 Internal and external clocks

The clock of the class-D amplifier can be generated internally or can be driven by an external source.

If two or more class-D amplifiers are used in the same system, it is recommended that all devices operate at the same clock frequency. This can be implemented by using one TDA7491P as master clock, while the other devices are in slave mode, that is, externally clocked. The clock interconnect is via pin SYNCLK of each device. As explained below, SYNCLK is an output in master mode and an input in slave mode.

5.5.1 Master mode (internal clock)

Using the internal oscillator, the output switching frequency, f_{SW} , is controlled by the resistor, R_{OSC} , connected to pin ROSC:

$$f_{SW} = 10^6 / ((16 * R_{OSC} + 182) * 4) \text{ kHz}$$

where R_{OSC} is in $k\Omega$.

In master mode, pin SYNCLK is used as a clock output pin, whose frequency is:

$$f_{SYNCLK} = 2 * f_{SW}$$

For master mode to operate correctly then resistor R_{OSC} must be less than 60 $k\Omega$ as given below in [Table 8](#).

5.5.2 Slave mode (external clock)

In order to accept an external clock input, pin ROSC must be left open, that is, floating. This forces pin SYNCLK to be internally configured as an input as given in [Table 8](#).

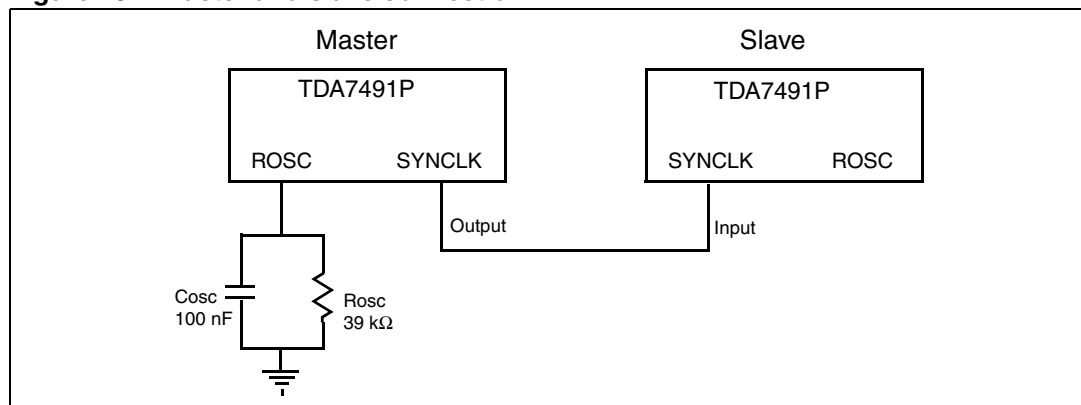

The output switching frequency of the slave devices is:

$$f_{SW} = f_{SYNCLK} / 2$$

Table 8. How to set up SYNCLK

Mode	ROSC	SYNCLK
Master	$R_{OSC} < 60 \text{ k}\Omega$	Output
Slave	Floating (not connected)	Input

Figure 43. Master and slave connection

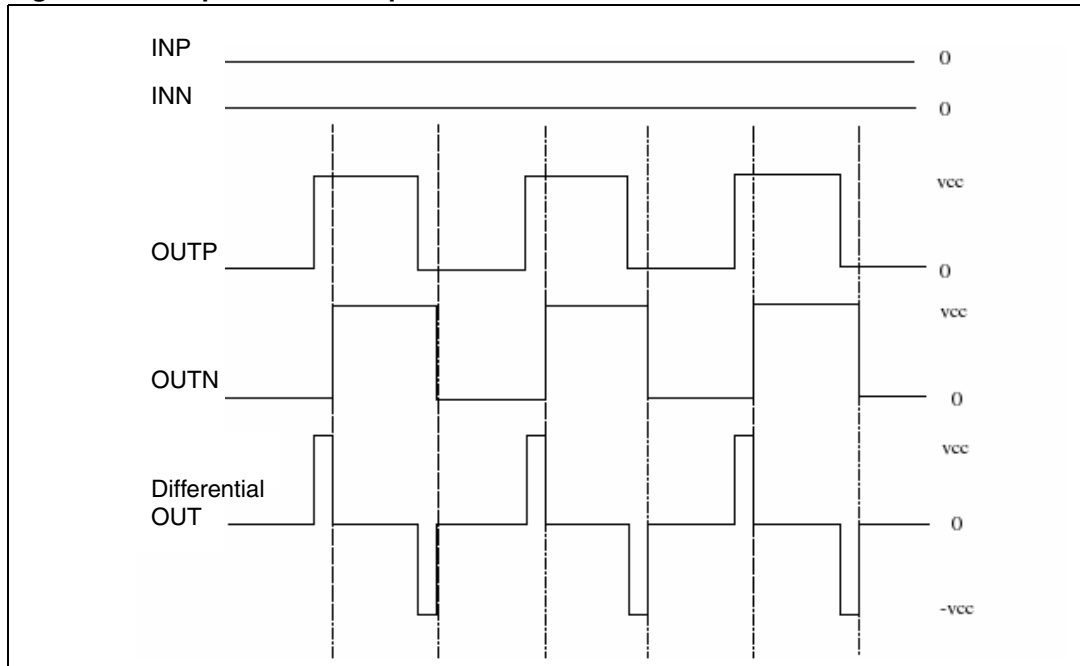

5.6 Modulation

The output modulation scheme of the BTL is called unipolar pulse width modulation (PWM). The differential output voltages change between 0 V and $+V_{CC}$ and between 0 V and $-V_{CC}$. This is in contrast to the traditional bipolar PWM outputs which change between $+V_{CC}$ and $-V_{CC}$.

An advantage of this scheme is that it effectively doubles the switching frequency of the differential output waveform on the load then reducing the current ripple accordingly. The OUP and OUTN are in the same phase almost overlapped when the input is zero under this condition, then the switching current is low and the related losses in the load are low. In practice, a short delay is introduced between these two outputs in order to avoid the BTL outputs switching simultaneously when the input is zero.

Figure 44 shows the resulting differential output voltage and current when a positive, zero and negative input signal is applied. The resulting differential voltage on the load has a double frequency with respect to outputs OUP and OUTN then resulting in reduced current ripple.

Figure 44. Unipolar PWM output

5.6.1 Reconstruction low-pass filter

Standard applications use a low-pass filter before the speaker. The cut-off frequency should be higher than 22 kHz and much lower than the output switching frequency. It is necessary to choose the L-C component values depending on the loud speaker impedance. Some typical values, which give a cut-off frequency of 27 kHz, are shown in [Figure 45](#) and [Figure 46](#) below.

Figure 45. Typical LC filter for an 8-Ω speaker

Figure 46. Typical LC filter for a 4-Ω speaker

5.6.2 Filterless modulation

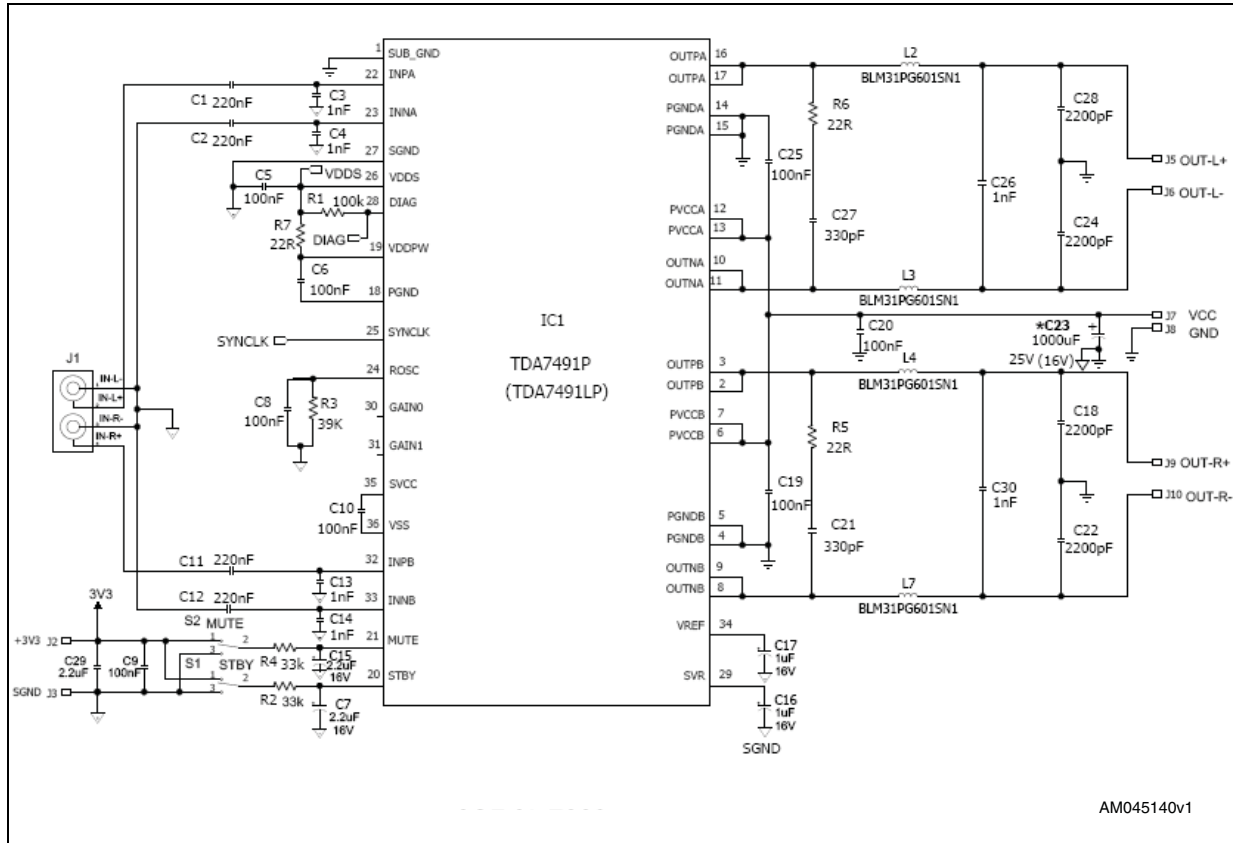

TDA7491P can be used without a filter at the IC outputs, because the frequency of the TDA7491P output is beyond the audio frequency, the audio signal can be recovered by the inherent inductance of the speaker and natural filter of the human ear.

The reconstruction of the audio signal on the load is usually achieved using a complete LC filter (such as a Butterworth) solution that guarantees good audio performance, high efficiency and EMI suppression. The LC component values should be computed by considering the target audio band and the PWM switching frequency. The cut-off frequency must lie well below the switching frequency and above the upper audio frequency. In particular, the following schematic gives a guideline for a cut-off frequency of about 30 kHz for both 6- and 8-Ω speakers.

Thanks to its advanced modulation approach, aimed to improve both driving efficiency and radiating emissions, the device is even able to drive a load with a very low component count. With this cost-saving filtering scheme the TDA7491P complies with the EMI specifications FCC class B. [Figure 47 on page 35](#) shows the simplified schematic adopted for the test and the relevant emission curve at full output power.

Emission tests have been performed with a 1-m length of twisted speaker wire with ferrite beads. Changing the type of the ferrite bead requires care due to factors such as its effectiveness in the EMC frequency range and impedance stability over the rated current range. An output snubber network further improves the emissions and this should be tuned according to the actual PCB, layout and component characteristics.

Figure 47. Filterless application schematic

5.7 Protection functions

The TDA7491P is fully protected against undervoltages, overcurrents and thermal overloads as explained here.

Undervoltage protection (UVP)

If the supply voltage drops below the value of V_{UVP} given in [Table 5: Electrical specifications on page 11](#) the undervoltage protection is activated which forces the outputs to the high-impedance state. When the supply voltage recovers the device restarts.

Overcurrent protection (OCP)

If the output current exceeds the value of I_{OCP} given in [Table 5: Electrical specifications on page 11](#) the overcurrent protection is activated which forces the outputs to the high-impedance state. Periodically, the device attempts to restart. If the overcurrent condition is still present then the OCP remains active. The restart time, T_{OC} , is determined by the R-C components connected to pin STBY.

Thermal protection (OTP)

If the junction temperature, T_j , reaches 145 °C (nominal), the device goes to mute mode and the positive and negative PWM outputs are forced to 50% duty cycle. If the junction temperature reaches the value for T_j given in [Table 5: Electrical specifications on page 11](#) the device shuts down and the output is forced to the high impedance state. When the device cools sufficiently the device restarts.

5.8 Diagnostic output

The output pin DIAG is an open drain transistor. When the protection is activated it is in the high-impedance state. The pin can be connected to a power supply (<18 V) by a pull-up resistor whose value is limited by the maximum sinking current (200 μ A) of the pin.

Figure 48. Behavior of pin DIAG for various protection conditions

5.9 Heatsink requirements

Due to the high efficiency of the class-D amplifier a 2-layer PCB can easily provide the heatsinking capability for low to medium power outputs.

Using such a PCB with a copper ground layer of 3 x 3 cm² and 16 vias connecting it to the contact area for the exposed pad, a thermal resistance, junction to ambient (in natural air convection), of 24 °C/W can be achieved.

The dissipated power within the device depends primarily on the supply voltage, load impedance and output modulation level. With the TDA7491P driving 2 x 6 Ω with a supply of 11 V then the maximum device dissipation is approximately 2 W.

When this power is dissipated at the maximum ambient temperature of 85 °C and the device is mounted on the above PCB then the junction temperature could reach:

$$T_j = T_{amb} + P_d * R_{j-amb} = 85 + 2 * 24 = 133 \text{ °C}$$

However, this temperature is sufficiently low to avoid triggering thermal warning.

With a musical program the dissipated power is about 40% less than the above maximum value. This leads to a junction temperature of around only 115 °C with the 9 cm² copper ground. A commensurately smaller heatsink can thus be used.

Figure 49 shows the power derating curve for the PowerSSO-36 package on PCBs with copper areas of 2 x 2 cm² and 3 x 3 cm².

Figure 49. Power derating curves for PCB used as heatsink

5.10 Test board

Figure 50. Test board (TDA7491P) layout

6 Package mechanical data

The TDA7491P comes in a 36-pin PowerSSO package with exposed pad down (EPD).

[Figure 51](#) below shows the package outline and [Table 9](#) gives the dimensions.

Table 9. PowerSSO-36 EPD dimensions

7 Revision history

Table 10. Document revision history

Date	Revision	Changes
02-Jul-2007	1	Initial release.
15-Oct-2008	2	Updated characterization curves.
23-Jun-2009	3	Updated text concerning oscillator R and C in Section 3.3: Electrical specifications on page 11 Updated condition for Iq test, added V _{UVp} maximum value, updated THD maximum value, updated STBY and MUTE voltages in Table 5: Electrical specifications on page 11 Updated equation for f _{SW} on page 11 and on page 32 Updated Figure 39: Applications circuit for class-D amplifier on page 29 Updated Section 5.7: Protection functions on page 36 .
04-Sep-2009	4	Added text for exposed pad in Figure 2 on page 8 Added text for exposed pad in Table 2 on page 9 Updated exposed pad Y (Min) dimension in Table 9 on page 39 Updated supply voltage for pin DIAG pull-up resistor in Section 5.8 on page 36 .
07-Mar-2011	5	Updated operating temperature range in Table 1 on page 1 Modified description of pins 10, 11 in Table 2 on page 9 Added V _I and updated operating temperature range in Table 3: Absolute maximum ratings on page 10 Updated Table 4: Thermal data on page 10 Updated Table 5: Electrical specifications on page 11 Updated introduction and characterization curves in Section 4 on page 13 Moved test board layout to Section 5.10 on page 38 Moved package mechanical data to Section 6 on page 39 Updated applications circuit in Figure 39 on page 29 Updated Table 7: Gain settings on page 31 Updated Section 5.6: Modulation on page 33 Added Figure 47: Filterless application schematic on page 35 Removed overvoltage protection from Section 5.7: Protection functions on page 36 Updated Section 5.9: Heatsink requirements on page 37 Updated exposed pad dimension Y in Table 9 on page 39
18-Jan-2012	6	Updated Table 7: Gain settings

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY TWO AUTHORIZED ST REPRESENTATIVES, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.

ST and the ST logo are trademarks or registered trademarks of ST in various countries.

Information in this document supersedes and replaces all information previously supplied.

The ST logo is a registered trademark of STMicroelectronics. All other names are the property of their respective owners.
