

# TC7136/TC7136A

## Low Power 3-1/2 Digit Analog-to-Digital Converter

### Features

- Fast Over Range Recovery, Ensured First Reading Accuracy
- Low Temperature Drift Internal Reference
  - TC7136: 70ppm/°C (Typ.)
  - TC7136A: 35ppm/°C (Typ.)
- Zero Reading with Zero Input
- Low Noise:  $15\mu V_{P-P}$
- High Resolution: 0.05%
- Low Input Leakage Current: 1pA (Typ.)/10pA (Max.)
- Precision Null Detectors with True Polarity at Zero
- High-Impedance Differential Input
- Convenient 9V Battery Operation with Low Power Dissipation:  $500\mu W$  (Typ.)/ $900\mu W$  (Max.)

### Applications

- Thermometry
- Bridge Readouts: Strain Gauges, Load Cells, Null Detectors
- Digital Meters: Voltage/Current/Ohms/Power, pH
- Digital Scales, Process Monitors
- Portable Instrumentation

### Device Selection Table

Part Number	Package	Temperature Range
TC7136 CPI	40-Pin PDIP	0°C to +70°C
TC7136 CKW	44-Pin PQFP	0°C to +70°C
TC7136 CLW	44-Pin PLCC	0°C to +70°C
TC7136A CPI	40-Pin PDIP	0°C to +70°C
TC7136A CKW	44-Pin PQFP	0°C to +70°C
TC7136A CLW	44-Pin PLCC	0°C to +70°C

### General Description

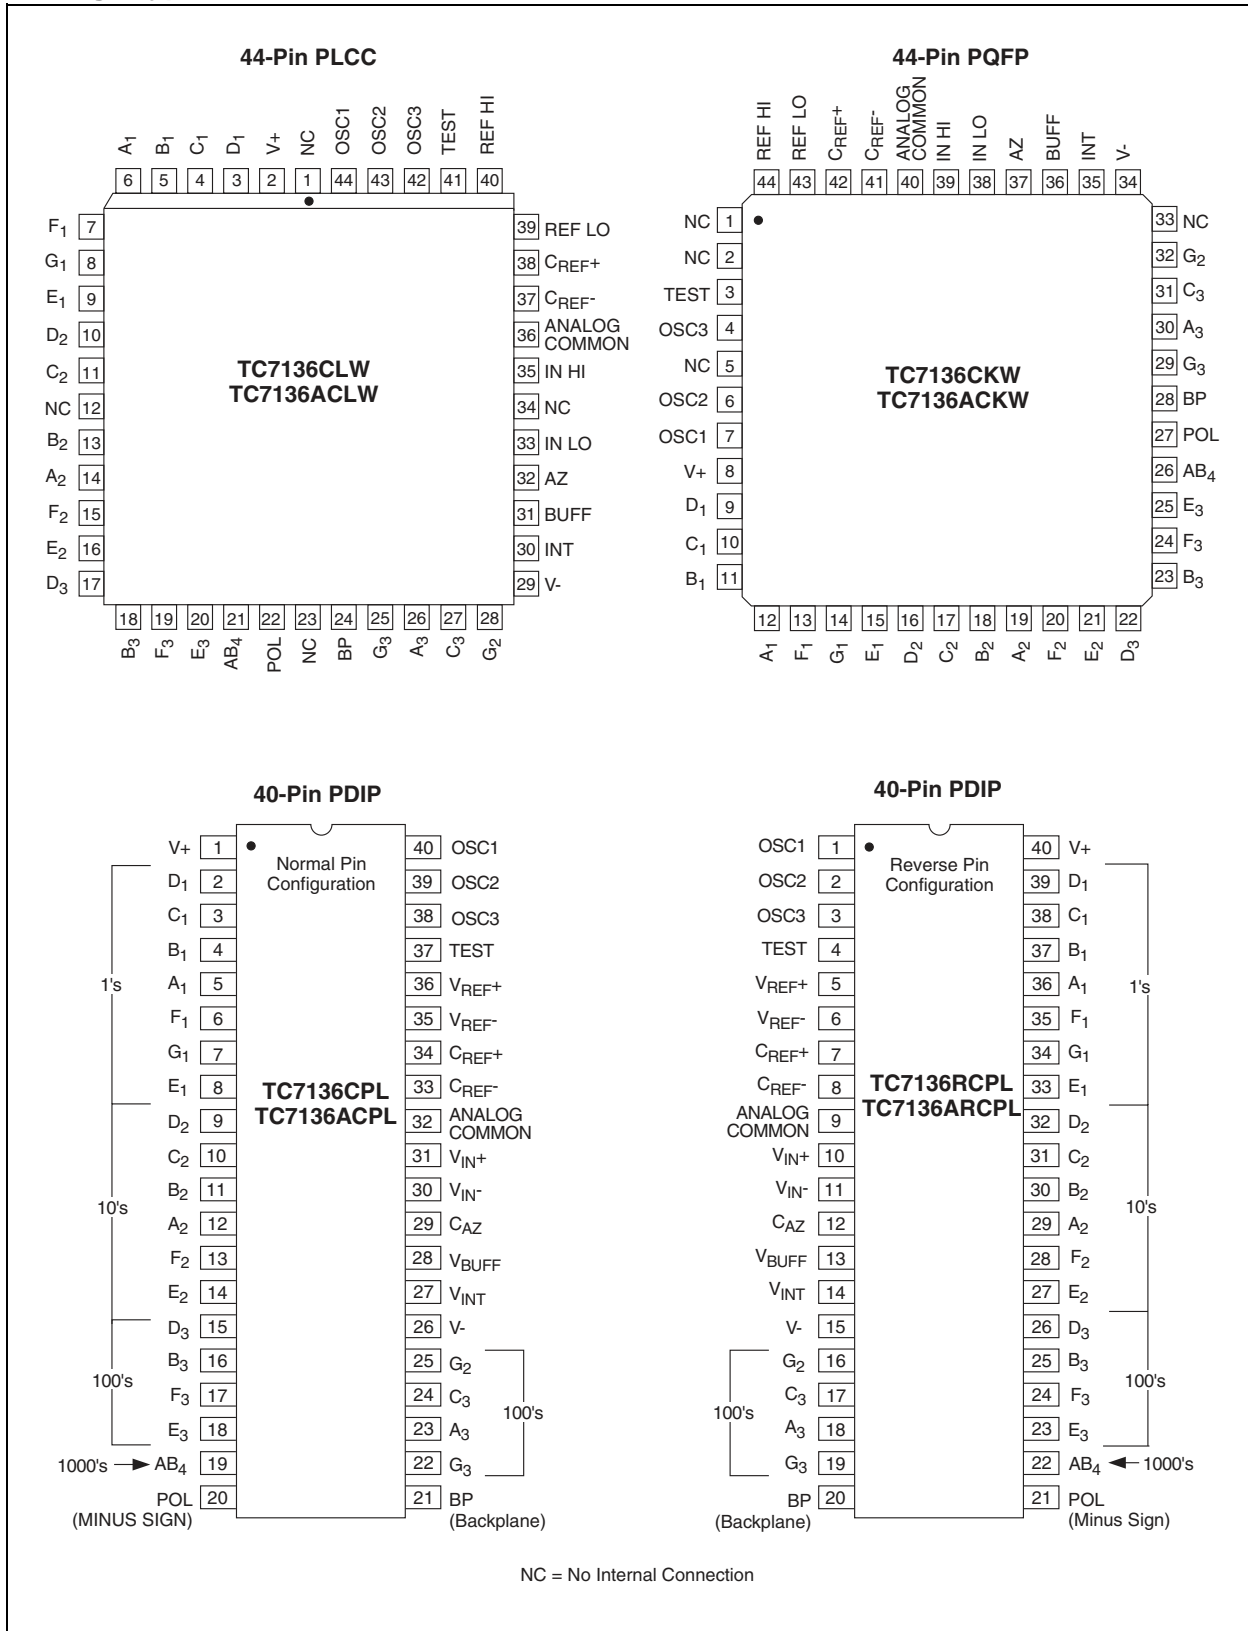

The TC7136 and TC7136A are low power, 3-1/2 digit with liquid crystal display (LCD) drivers and analog-to-digital converters. These devices incorporate an "integrator output zero" phase, which enables over range recovery. The performance of existing TC7126, TC7126A and ICL7126 based systems may be upgraded with minor changes to external, passive components.

The TC7136A has an improved internal zener reference voltage circuit which maintains the analog common temperature drift to 35ppm/°C (typical) and 75ppm/°C (maximum). This represents an improvement of two to four times over similar 3-1/2 digit converters. The costly, space consuming external reference source may be removed.

The TC7136 and TC7136A limit linearity error to less than 1 count on 200mV or 2V full scale ranges. The roll-over error (the difference in readings for equal magnitude, but opposite polarity input signals) is below  $\pm 1$  count. High-impedance differential inputs offer 1pA leakage currents and a  $10^{12}\Omega$  input impedance. The differential reference input allows ratiometric measurements for ohms or bridge transducer measurements. The  $15\mu V_{P-P}$  noise performance ensures a "rock solid" reading. The auto-zero cycle enables a zero display readout for a 0V input.

## 2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

**TABLE 2-1: PIN DESCRIPTION**

Pin Number (40-Pin PDIP) Normal	(Reverse)	Symbol	Description
1	(40)	V+	Positive supply voltage.
2	(39)	D <sub>1</sub>	Activates the D section of the units display.
3	(38)	C <sub>1</sub>	Activates the C section of the units display.
4	(37)	B <sub>1</sub>	Activates the B section of the units display.
5	(36)	A <sub>1</sub>	Activates the A section of the units display.
6	(35)	F <sub>1</sub>	Activates the F section of the units display.
7	(34)	G <sub>1</sub>	Activates the G section of the units display.
8	(33)	E <sub>1</sub>	Activates the E section of the units display.
9	(32)	D <sub>2</sub>	Activates the D section of the tens display.
10	(31)	C <sub>2</sub>	Activates the C section of the tens display.
11	(30)	B <sub>2</sub>	Activates the B section of the tens display.
12	(29)	A <sub>2</sub>	Activates the A section of the tens display.
13	(28)	F <sub>2</sub>	Activates the F section of the tens display.
14	(27)	E <sub>2</sub>	Activates the E section of the tens display.
15	(26)	D <sub>3</sub>	Activates the D section of the hundreds display.
16	(25)	B <sub>3</sub>	Activates the B section of the hundreds display.
17	(24)	F <sub>3</sub>	Activates the F section of the hundreds display.
18	(23)	E <sub>3</sub>	Activates the E section of the hundreds display.
19	(22)	AB <sub>4</sub>	Activates both halves of the 1 in the thousands display.
20	(21)	POL	Activates the negative polarity display.
21	(20)	BP	Backplane drive output.
22	(19)	G <sub>3</sub>	Activates the G section of the hundreds display.
23	(18)	A <sub>3</sub>	Activates the A section of the hundreds display.
24	(17)	C <sub>3</sub>	Activates the C section of the hundreds display.
25	(16)	G <sub>2</sub>	Activates the G section of the tens display.
26	(15)	V-	Negative power supply voltage.
27	(14)	V <sub>INT</sub>	The integrating capacitor should be selected to give the maximum voltage swing that ensures component tolerance buildup will not allow the integrator output to saturate. When analog common is used as a reference and the conversion rate is 3 readings per second, a 0.047μF capacitor may be used. The capacitor must have a low dielectric constant to prevent rollover errors. See Section 6.3, Integrating Capacitor for additional details.
28	(13)	V <sub>BUFF</sub>	Integration resistor connection. Use a 180kΩ for a 20mV full scale range and a 1.8MΩ for 2V full scale range.
29	(12)	C <sub>AZ</sub>	The size of the auto-zero capacitor influences the system noise. Use a 0.47μF capacitor for a 200mV full scale and a 0.1μF capacitor for a 2V full scale. See Section 6.1, Auto-Zero Capacitor for more details.
30	(11)	V <sub>IN-</sub>	The low input signal is connected to this pin.
31	(10)	V <sub>IN+</sub>	The high input signal is connected to this pin.
32	(9)	ANALOG COMMON	This pin is primarily used to set the Analog Common mode voltage for battery operation, or in systems where the input signal is referenced to the power supply. See Section 7.3, Analog Common for more details. It also acts as a reference voltage source.
33	(8)	C <sub>REF-</sub>	See Pin 34.

# TC7136/TC7136A

TABLE 2-1: PIN DESCRIPTION (CONTINUED)

Pin Number (40-Pin PDIP) Normal	(Reverse)	Symbol	Description
34	(7)	$C_{REF+}$	A 0.1 $\mu$ F capacitor is used in most applications. If a large Common mode voltage exists (for example, the $V_{IN-}$ pin is not at analog common) and a 200mV scale is used, a 1 $\mu$ F capacitor is recommended, which will hold the rollover error to 0.5 count.
35	(6)	$V_{REF-}$	See Pin 36.
	(5)	$V_{REF+}$	The analog input required to generate a full scale output (1999 counts). Place 100mV between Pins 35 and 36 for 199.9mV full scale. Place 1V between Pins 35 and 36 for 2V full scale. See Section 6.6, Reference Voltage.
36	(4)	TEST	Lamp test. When pulled HIGH (to V+), all segments will be turned ON and the display should read -1888. It may also be used as a negative supply for externally generated decimal points. See Section 7.4, Test for additional information.
37	(3)	OSC3	See Pin 40.
38	(2)	OSC2	See Pin 40.
39	(1)	OSC1	Pins 40, 39 and 38 make up the oscillator section. For a 48kHz clock (3 readings per second), connect Pin 40 to the junction of a 180k $\Omega$ resistor and a 50pF capacitor. The 180k $\Omega$ resistor is tied to Pin 39 and the 50pF capacitor is tied to Pin 38.

## 3.0 DETAILED DESCRIPTION

(All Pin Designations Refer to 40-Pin PDIP.)

### 3.1 Dual Slope Conversion Principles

The TC7136/A is a dual slope, integrating analog-to-digital converter. An understanding of the dual slope conversion technique will aid in following detailed TC7136/A operational theory.

The conventional dual slope converter measurement cycle has two distinct phases (see Figure 3-1).

1. Input signal integration
2. Reference voltage integration (de-integration)

The input signal being converted is integrated for a fixed time period ( $t_{SI}$ ), measured by counting clock pulses. An opposite polarity constant reference voltage is then integrated until the integrator output voltage returns to zero. The reference integration time is directly proportional to the input signal ( $t_{RI}$ ).

In a simple dual slope converter, a complete conversion requires the integrator output to "ramp up" and "ramp down."

A simple mathematical equation relates the input signal, reference voltage, and integration time:

#### EQUATION 3-1:

$$\frac{1}{RC} \int_0^{t_{SI}} V_{IN}(t) dt = \frac{V_R t_{RI}}{RC}$$

Where:

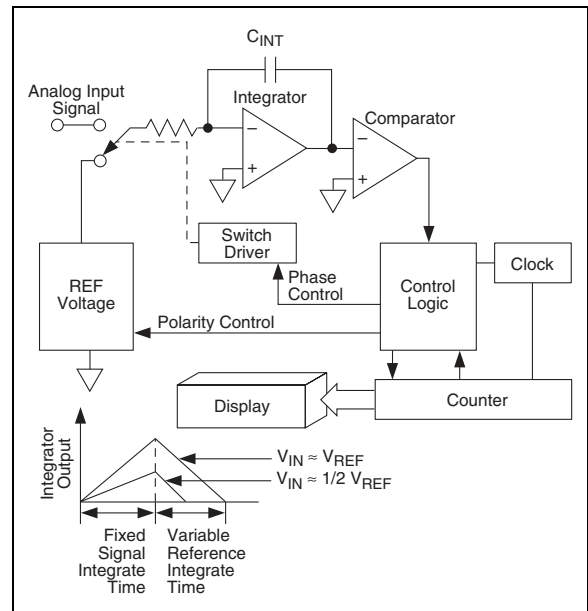

- $V_R$  = Reference voltage
- $t_{SI}$  = Signal integration time (fixed)
- $t_{RI}$  = Reference voltage integration time (variable)

For a constant  $V_{IN}$ :

#### EQUATION 3-2:

$$V_{IN} = V_R \frac{t_{RI}}{t_{SI}}$$

**FIGURE 3-1: BASIC DUAL SLOPE CONVERTER**

**FIGURE 3-2: NORMAL MODE REJECTION OF DUAL SLOPE CONVERTER**

The dual slope converter accuracy is unrelated to the integrating resistor and capacitor values, as long as they are stable during a measurement cycle. Noise immunity is an inherent benefit. Noise spikes are integrated or averaged to zero during integration periods. Integrating ADCs are immune to the large conversion errors that plague successive approximation converters in high noise environments. Interfering signals with frequency components at multiples of the averaging period will be attenuated. Integrating ADCs commonly operate with the signal integration period set to a multiple of the 50Hz/60Hz power line period.

# TC7136/TC7136A

## 4.0 ANALOG SECTION

In addition to the basic integrate and de-integrate dual slope cycles discussed above, the TC7136 and TC7136A designs incorporate an "integrator output zero cycle" and an "auto-zero cycle." These additional cycles ensure the integrator starts at 0V (even after a severe over range conversion) and that all offset voltage errors (buffer amplifier, integrator and comparator) are removed from the conversion. A true digital zero reading is assured without any external adjustments.

A complete conversion consists of four distinct phases:

1. Integrator output zero phase
2. Auto-zero phase
3. Signal integrate phase
4. Reference de-integrate phase

### 4.1 Integrator Output Zero Phase

This phase ensures the integrator output is at 0V before the system zero phase is entered. This ensures that true system offset voltages will be compensated for, even after an over range conversion. The count for this phase is a function of the number of counts required by the de-integrate phase. The count lasts from 11 to 140 counts for non over range conversions and from 31 to 640 counts for over range conversions.

### 4.2 Auto-Zero Phase

During the auto-zero phase, the differential input signal is disconnected from the circuit by opening internal analog gates. The internal nodes are shorted to analog common (ground) to establish a zero input condition. Additional analog gates close a feedback loop around the integrator and comparator. This loop permits comparator offset voltage error compensation. The voltage level established on  $C_{AZ}$  compensates for device offset voltages. The auto-zero phase residual is typically 10 $\mu$ V to 15 $\mu$ V.

The auto-zero duration is from 910 to 2900 counts for non over range conversions and from 300 to 910 counts for over range conversions.

### 4.3 Signal Integration Phase

The auto-zero loop is entered and the internal differential inputs connect to  $V_{IN+}$  and  $V_{IN-}$ . The differential input signal is integrated for a fixed time period. The TC7136/A signal integration period is 1000 clock periods or counts. The externally set clock frequency is divided by four before clocking the internal counters. The integration time period is:

**EQUATION 4-1:**

$$t_{SI} = \frac{4}{F_{OSC}} \times 1000$$

Where  $F_{OSC}$  = external clock frequency.

The differential input voltage must be within the device Common mode range when the converter and measured system share the same power supply common (ground). If the converter and measured system do not share the same power supply common,  $V_{IN-}$  should be tied to analog common.

Polarity is determined at the end of signal integrate phase. The sign bit is a true polarity indication, in that signals less than 1LSB are correctly determined. This allows precision null detection, limited only by device noise and auto-zero residual offsets.

### 4.4 Reference Integrate Phase

The third phase is reference integrate or de-integrate.  $V_{IN-}$  is internally connected to analog common and  $V_{IN+}$  is connected across the previously charged reference capacitor. Circuitry within the chip ensures that the capacitor will be connected with the correct polarity to cause the integrator output to return to zero. The time required for the output to return to zero is proportional to the input signal and is between 0 and 2000 internal clock periods. The digital reading displayed is:

**EQUATION 4-2:**

$$1000 = \frac{V_{IN}}{V_{REF}}$$

**FIGURE 4-1: CONVERSION TIMING DURING NORMAL OPERATION**

**FIGURE 4-2: CONVERSION TIMING DURING OVER RANGE OPERATION**

## 5.0 DIGITAL SECTION

The TC7136/A contains all the segment drivers necessary to directly drive a 3-1/2 digit LCD. An LCD backplane driver is included. The backplane frequency is the external clock frequency divided by 800. For three conversions per second, the backplane frequency is 60Hz with a 5V nominal amplitude. When a segment driver is in phase with the backplane signal, the segment is OFF. An out-of-phase segment drive signal causes the segment to be ON, or visible. This AC drive configuration results in negligible DC voltage across each LCD segment, ensuring long LCD life. The polarity segment driver is ON for negative analog inputs. If  $V_{IN+}$  and  $V_{IN-}$  are reversed, this indicator would reverse.

On the TC7136/A, when the TEST pin is pulled to  $V+$ , all segments are turned ON. The display reads -1888. During this mode, the LCD segments have a constant DC voltage impressed.

**Note:** Do not leave the display in this mode for more than several minutes. LCDs may be destroyed if operated with DC levels for extended periods.

The display font and segment drive assignment are shown in Figure 5-1.

**FIGURE 5-1: DISPLAY FONT AND SEGMENT ASSIGNMENT**

### 5.1 System Timing

The oscillator frequency is divided by 4 prior to clocking the internal decade counters. The four-phase measurement cycle takes a total of 4000 counts, or 16,000 clock pulses. The 4000 count cycle is independent of input signal magnitude.

Each phase of the measurement cycle has the following length:

1. Auto-zero phase: 3000 to 2900 counts (1200 to 11,600 clock pulses)
2. Signal integrate: 1000 counts (4000 clock pulses)

This time period is fixed. The integration period is:

#### EQUATION 5-1:

Where:

$$t_{SI} = 4000 \left( \frac{1}{F_{OSC}} \right)$$

$F_{OSC}$  is the externally set clock frequency.

3. Reference integrate: 0 to 2000 counts
4. Zero integrator: 11 to 640 counts

The TC7136 is a drop-in replacement for the TC7126 and ICL7126. The TC7136A offers a greatly improved internal reference temperature coefficient. Minor component value changes are required to upgrade existing designs and improve the noise performance.

## 6.0 COMPONENT VALUE SELECTION

### 6.1 Auto-Zero Capacitor ( $C_{AZ}$ )

The  $C_{AZ}$  capacitor size has some influence on system noise. A  $0.47\mu\text{F}$  capacitor is recommended for 200mV full scale applications, where 1LSB is  $100\mu\text{V}$ . A  $0.1\mu\text{F}$  capacitor is adequate for 2V full scale applications. A Mylar type dielectric capacitor is adequate.

### 6.2 Reference Voltage Capacitor ( $C_{REF}$ )

The reference voltage, used to ramp the integrator output voltage back to zero during the reference integrate phase, is stored on  $C_{REF}$ . A  $0.1\mu\text{F}$  capacitor is acceptable when  $V_{REF-}$  is tied to analog common. If a large Common mode voltage exists ( $V_{REF-} \neq$  analog common) and the application requires a 200mV full scale, increase  $C_{REF}$  to  $1\mu\text{F}$ . Rollover error will be held to less than 0.5 count. A Mylar type dielectric capacitor is adequate.

### 6.3 Integrating Capacitor ( $C_{INT}$ )

$C_{INT}$  should be selected to maximize integrator output voltage swing without causing output saturation. Analog common will normally supply the differential voltage reference in this case, a  $\pm 2\text{V}$  full scale integrator output swing is satisfactory. For 3 readings per second ( $F_{OSC} = 48\text{kHz}$ ), a  $0.047\mu\text{F}$  value is suggested. For one reading per second,  $0.15\mu\text{F}$  is recommended. If a different oscillator frequency is used,  $C_{INT}$  must be changed in inverse proportion to maintain the nominal  $\pm 2\text{V}$  integrator swing.

# TC7136/TC7136A

An exact expression for  $C_{INT}$  is:

**EQUATION 6-1:**

$$C_{INT} = \frac{(4000) \left( \frac{1}{F_{OSC}} \right) \left( \frac{V_{FS}}{R_{INT}} \right)}{V_{INT}}$$

Where:

- $F_{OSC}$  = Clock frequency at Pin 38
- $V_{FS}$  = Full scale input voltage
- $R_{INT}$  = Integrating resistor
- $V_{INT}$  = Desired full scale integrator output swing

$C_{INT}$  must have low dielectric absorption to minimize rollover error. A polypropylene capacitor is recommended.

## 6.4 Integrating Resistor ( $R_{INT}$ )

The input buffer amplifier and integrator are designed with Class A output stages. The output stage idling current is  $6\mu A$ . The integrator and buffer can supply  $1\mu A$  drive currents with negligible linearity errors.  $R_{INT}$  is chosen to remain in the output stage linear drive region, but not so large that PC board leakage currents induce errors. For a 200mV full scale,  $R_{INT}$  is 180k $\Omega$ . A 2V full scale requires 1.8M $\Omega$  (see Table 6-1).

**TABLE 6-1:**

Component Value	Nominal Full Scale Voltage	
	200mV	2V
$C_{AZ}$	0.47 $\mu F$	0.1 $\mu F$
$R_{INT}$	180k $\Omega$	1.8M $\Omega$
$C_{INT}$	0.047 $\mu F$	0.047 $\mu F$

**Note:**  $F_{OSC} = 48kHz$  (3 reading per sec).  
 $R_{OSC} = 180k\Omega$ ,  $C_{OSC} = 50pF$ .

## 6.5 Oscillator Components

$C_{OSC}$  should be 50pF.  $R_{OSC}$  is selected from the equation:

**EQUATION 6-2:**

$$F_{OSC} = \frac{0.45}{RC}$$

Note that  $F_{OSC}$  is  $\div 4$  to generate the TC7136A's internal clock. The backplane drive signal is derived by dividing  $F_{OSC}$  by 800.

To achieve maximum rejection of 60Hz noise pickup, the signal integrate period should be a multiple of 60Hz. Oscillator frequencies of 240kHz, 120kHz, 80kHz, 60kHz, 40kHz, etc. should be selected. For 50Hz rejection, oscillator frequencies of 200kHz, 100kHz, 66-2/3kHz, 50kHz, 40kHz, etc. would be suitable. Note that 40kHz (2.5 readings per second) will reject both 50Hz and 60Hz.

## 6.6 Reference Voltage Selection

A full scale reading (2000 counts) requires the input signal be twice the reference voltage.

Required Full Scale Voltage*	$V_{REF}$
200mV	100mV
2V	1V

**Note:**  $*V_{REF} = 2V_{REF}$ .

In some applications, a scale factor other than unity may exist between a transducer output voltage and the required digital reading. Assume, for example, a pressure transducer output for 2000 lb/in<sup>2</sup> is 400mV. Rather than dividing the input voltage by two, the reference voltage should be set to 200mV. This permits the transducer input to be used directly. The differential reference can also be used when a digital zero reading is required, when  $V_{IN}$  is not equal to zero. This is common in temperature measuring instrumentation. A compensating offset voltage can be applied between analog common and  $V_{IN-}$ . The transducer output is connected between  $V_{IN+}$  and analog common.

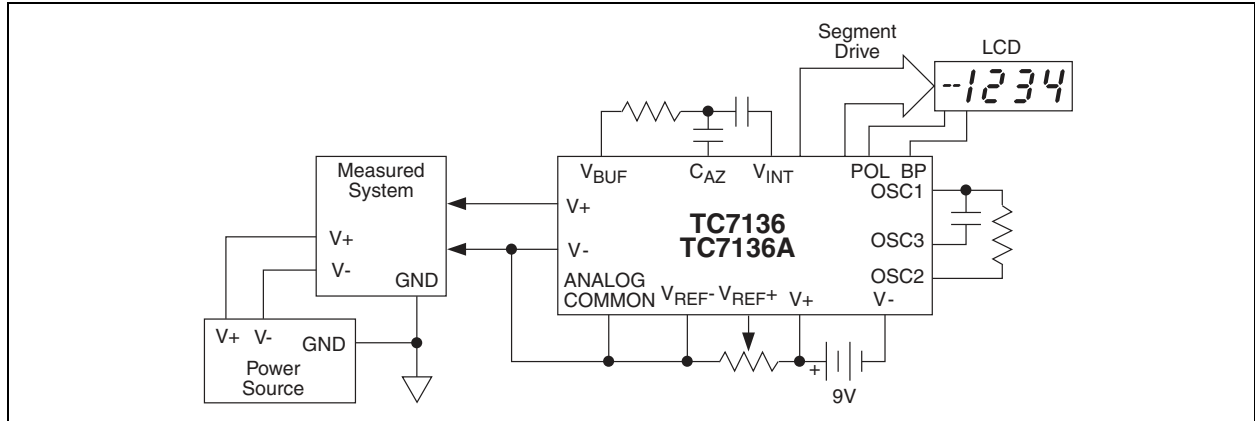

## 7.0 DEVICE PIN FUNCTIONAL DESCRIPTION

### 7.1 Differential Signal Inputs $V_{IN+}$ (Pin 31), $V_{IN-}$ (Pin 30)

The TC7136/A is designed with true differential inputs and accepts input signals within the input stage Common mode voltage range ( $V_{CM}$ ). The typical range is

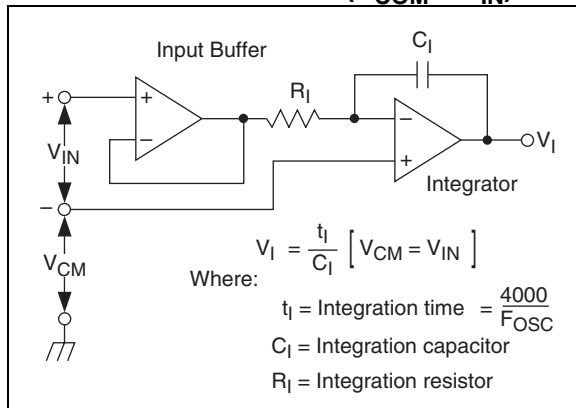

$V_+ - 1V$  to  $V_- + 1V$ . Common mode voltages are removed from the system when the TC7136A operates from a battery or floating power source (isolated from measured system), Common mode voltage removed in battery operation with  $V_{IN} =$  analog common and  $V_{IN-}$  is connected to analog common ( $V_{COM}$ ) (see Figure 7-1).

**FIGURE 7-1: COMMON MODE VOLTAGE REMOVED IN BATTERY OPERATION WITH  $V_{IN} =$  ANALOG COMMON**

In systems where Common mode voltages exist, the 86dB Common mode rejection ratio minimizes error. Common mode voltages do, however, affect the integrator output level. A worst case condition exists if a large positive  $V_{CM}$  exists in conjunction with a full scale negative differential signal. The negative signal drives the integrator output positive along with  $V_{CM}$  (see Figure 7-2.) For such applications, the integrator output swing can be reduced below the recommended 2V full scale swing. The integrator output will swing within 0.3V of  $V_+$  or  $V_-$  without increased linearity error.

**FIGURE 7-2: COMMON MODE VOLTAGE REDUCES AVAILABLE INTEGRATOR SWING ( $V_{COM} \neq V_{IN}$ )**

### 7.2 Differential Reference $V_{REF+}$ (Pin 36), $V_{REF-}$ (Pin 35)

The reference voltage can be generated anywhere within the  $V_+$  to  $V_-$  power supply range.

To prevent rollover type errors being induced by large Common mode voltages,  $C_{REF}$  should be large compared to stray node capacitance. The TC7136/A offers a significantly improved analog common temperature coefficient. This potential provides a very stable voltage, suitable for use as a voltage reference. The temperature coefficient of analog common is typically 35ppm/ $^{\circ}C$ .

### 7.3 Analog Common (Pin 32)

The analog common pin is set at a voltage potential approximately 3V below  $V_+$ . The potential is between 2.7V and 3.35V below  $V_+$ . Analog common is tied internally to an N-channel FET, capable of sinking 100 $\mu A$ . This FET will hold the common line at 3V below  $V_+$  if an external load attempts to pull the common line toward  $V_+$ . Analog common source current is limited to 1 $\mu A$ . Analog common is, therefore, easily pulled to a more negative voltage (i.e., below  $V_+ - 3V$ ).

# TC7136/TC7136A

The TC7136/A connects the internal  $V_{IN+}$  and  $V_{IN-}$  inputs to analog common during the auto-zero phase. During the reference integrate phase,  $V_{IN-}$  is connected to analog common. If  $V_{IN-}$  is not externally connected to analog common, a Common mode voltage exists, but is rejected by the converter's 86dB Common mode rejection ratio. In battery operation, analog common and  $V_{IN-}$  are usually connected, removing Common mode voltage concerns. In systems where  $V_{IN-}$  is connected to the power supply ground or to a given voltage, analog common should be connected to  $V_{IN-}$ .

The analog common pin serves to set the analog section reference, or common point. The TC7136A is specifically designed to operate from a battery, or in any measurement system where input signals are not referenced (float), with respect to the TC7136A power source. The analog common potential of  $V+ - 3V$  gives a 7V end of battery life voltage. The common potential has a 0.001%/°C voltage coefficient.

With sufficiently high total supply voltage ( $V+ - V- > 7V$ ), analog common is a very stable potential with excellent temperature stability (typically 35ppm/°C for TC7136A). This potential can be used to generate the TC7136A's reference voltage. An external voltage reference will be unnecessary in most cases, because of the 35ppm/°C temperature coefficient. See Section 7.5, TC7136A Internal Voltage Reference discussion.

## 7.4 TEST (Pin 37)

The TEST pin potential is 5V less than  $V+$ . TEST may be used as the negative power supply connection for external CMOS logic. The TEST pin is tied to the internally generated negative logic supply through a 500Ω resistor. The TEST pin load should not be more than 1mA. See Section 8.0, Typical Applications for additional information on using TEST as a negative digital logic supply.

If TEST is pulled high (to  $V+$ ), all segments plus the minus sign will be activated. DO NOT OPERATE IN THIS MODE FOR MORE THAN SEVERAL MINUTES. With TEST =  $V+$ , the LCD segments are impressed with a DC voltage which will destroy the LCD.

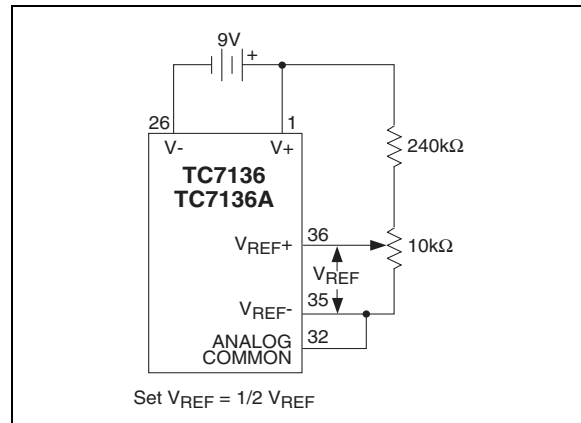

## 7.5 TC7136A Internal Voltage Reference

The TC7136 analog common voltage temperature stability has been significantly improved (Figure 7-3). The "A" version of the industry standard TC7136 device allows users to upgrade old systems and design new systems without external voltage references. External R and C values do not need to be changed; however, noise performance will be improved by increasing  $C_{AZ}$  (see Section 6.1, Auto-Zero Capacitor). Figure 7-4 shows analog common supplying the necessary reference for the TC7136/A.

## 8.0 TYPICAL APPLICATIONS

### 8.1 Liquid Crystal Display Sources

Several manufacturers supply standard LCDs to interface with the TC7136A 3-1/2 digit analog-to-digital converter.

Manufac.	Address/Phone	Representative Part Numbers*
Crystaloid Electronics	5282 Hudson Dr. Hudson, OH 44236 216-655-2429	C5335, H5535, T5135, SX440
AND	720 Palomar Ave. Sunnyvale, CA 94086 408-523-8200	FE 0201, 0501 FE 0203, 0701 FE 2201
VGI, Inc.	1800 Vernon St. Ste.2, Roseville, CA 95678 916-783-7878	I1048, I1126
Hamlin, Inc.	612 E. Lake St. Lake Mills, WI 53551 414-648-236100	3902, 3933, 3903

**Note:** Contact LCD manufacturer for full product listing/specifications.

### 8.2 Decimal Point and Annunciator Drive

The TEST pin is connected to the internally generated digital logic supply ground through a 500Ω resistor. The TEST pin may be used as the negative supply for external CMOS gate segment drivers. LCD annunciators for decimal points, low battery indication, or function indication may be added without adding an additional supply. No more than 1mA should be supplied by the TEST pin; its potential is approximately 5V below V+.

### 8.3 Ratiometric Resistance Measurements

The TC7136A's true differential input and differential reference make ratiometric readings possible. In ratiometric operation, an unknown resistance is measured with respect to a known standard resistance. No accurately defined reference voltage is needed.

The unknown resistance is put in series with a known standard and a current passed through the pair. The voltage developed across the unknown is applied to the input and the voltage across the known resistor applied to the reference input. If the unknown equals the standard, the display will read 1000. The displayed reading can be determined from the following expression:

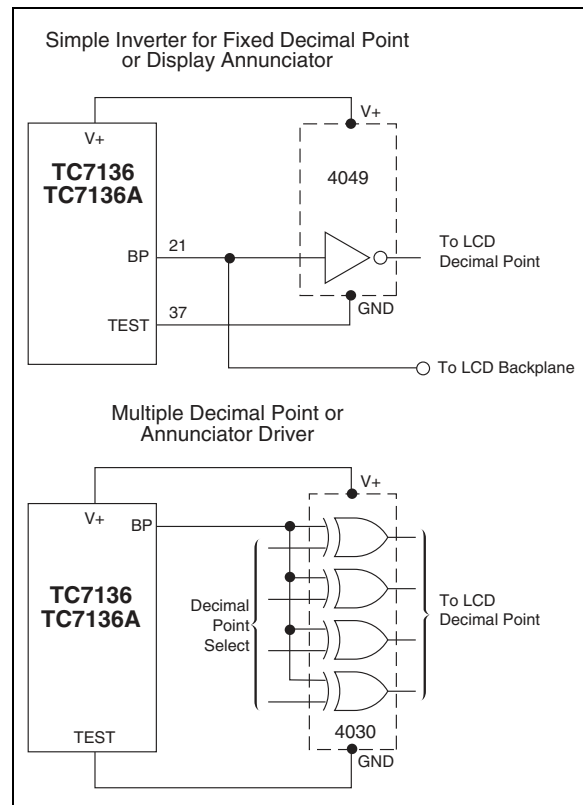

#### EQUATION 8-1:

$$\text{Displayed(Reading)} = \frac{R_{\text{UNKNOWN}}}{R_{\text{STANDARD}}} \times 1000$$

The display will over range for:

$$R_{\text{UNKNOWN}} \geq 2 \times R_{\text{STANDARD}}$$

## SALES AND SUPPORT

### **Data Sheets**

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site ([www.microchip.com](http://www.microchip.com))

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### **New Customer Notification System**

Register on our web site ([www.microchip.com/cn](http://www.microchip.com/cn)) to receive the most current information on our products.

---

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM**  
**CERTIFIED BY DNV**  
**== ISO/TS 16949:2002 ==**

*Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELoQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
