

SN74CBTLV3245 LOW-VOLTAGE OCTAL FET BUS SWITCH

SCDS034F – JULY 1997 – REVISED MAY 1998

- Standard '245-Type Pinout
- 5-Ω Switch Connection Between Two Ports
- Isolation Under Power-Off Conditions
- ESD Protection Exceeds 2000 V Per MIL-STD-883, Method 3015; Exceeds 200 V Using Machine Model (C = 200 pF, R = 0)
- Package Options Include Shrink Small-Outline (DB), Thin Very Small-Outline (DGV), Small-Outline (DW), and Thin Shrink Small-Outline (PW) Packages

description

The SN74CBTLV3245 provides eight bits of high-speed bus switching in a standard '245 device pinout. The low on-state resistance of the switch allows connections to be made with minimal propagation delay.

The device is organized as one 8-bit switch. When output enable (\overline{OE}) is low, the 8-bit bus switch is on and port A is connected to port B. When \overline{OE} is high, the switch is open and a high-impedance state exists between the two ports.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

The SN74CBTLV3245 is characterized for operation from -40°C to 85°C .

DESCRIPTION

[▲ Back to Top](#)

The SN74CBTLV3245 provides eight bits of high-speed bus switching in a standard '245 device pinout. The low on-state resistance of the switch allows connections to be made with minimal propagation delay.

The device is organized as one 8-bit switch. When output enable (OE \backslash) is low, the 8-bit bus switch is on and port A is connected to port B. When OE \backslash is high, the switch is open and a high-impedance state exists between the two ports.

To ensure the high-impedance state during power up or power down, OE \backslash should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-

sinking capability of the driver.

The SN74CBTLV3245 is characterized for operation from -40°C to 85°C.
